CURRENT WORKFLOW / CONTRIBUTOR AND REVIEWER

Capture, review, and stay informed

Open Sponsor Highlights, load the project list, choose a project, and enter a non-sensitive highlight. Submit once and wait for the result panel.

Highlight saved confirms a GitLab logbook receipt. ACORN review, graduation, merge, and reporting happen afterward. Keep the receipt ID if you need support.

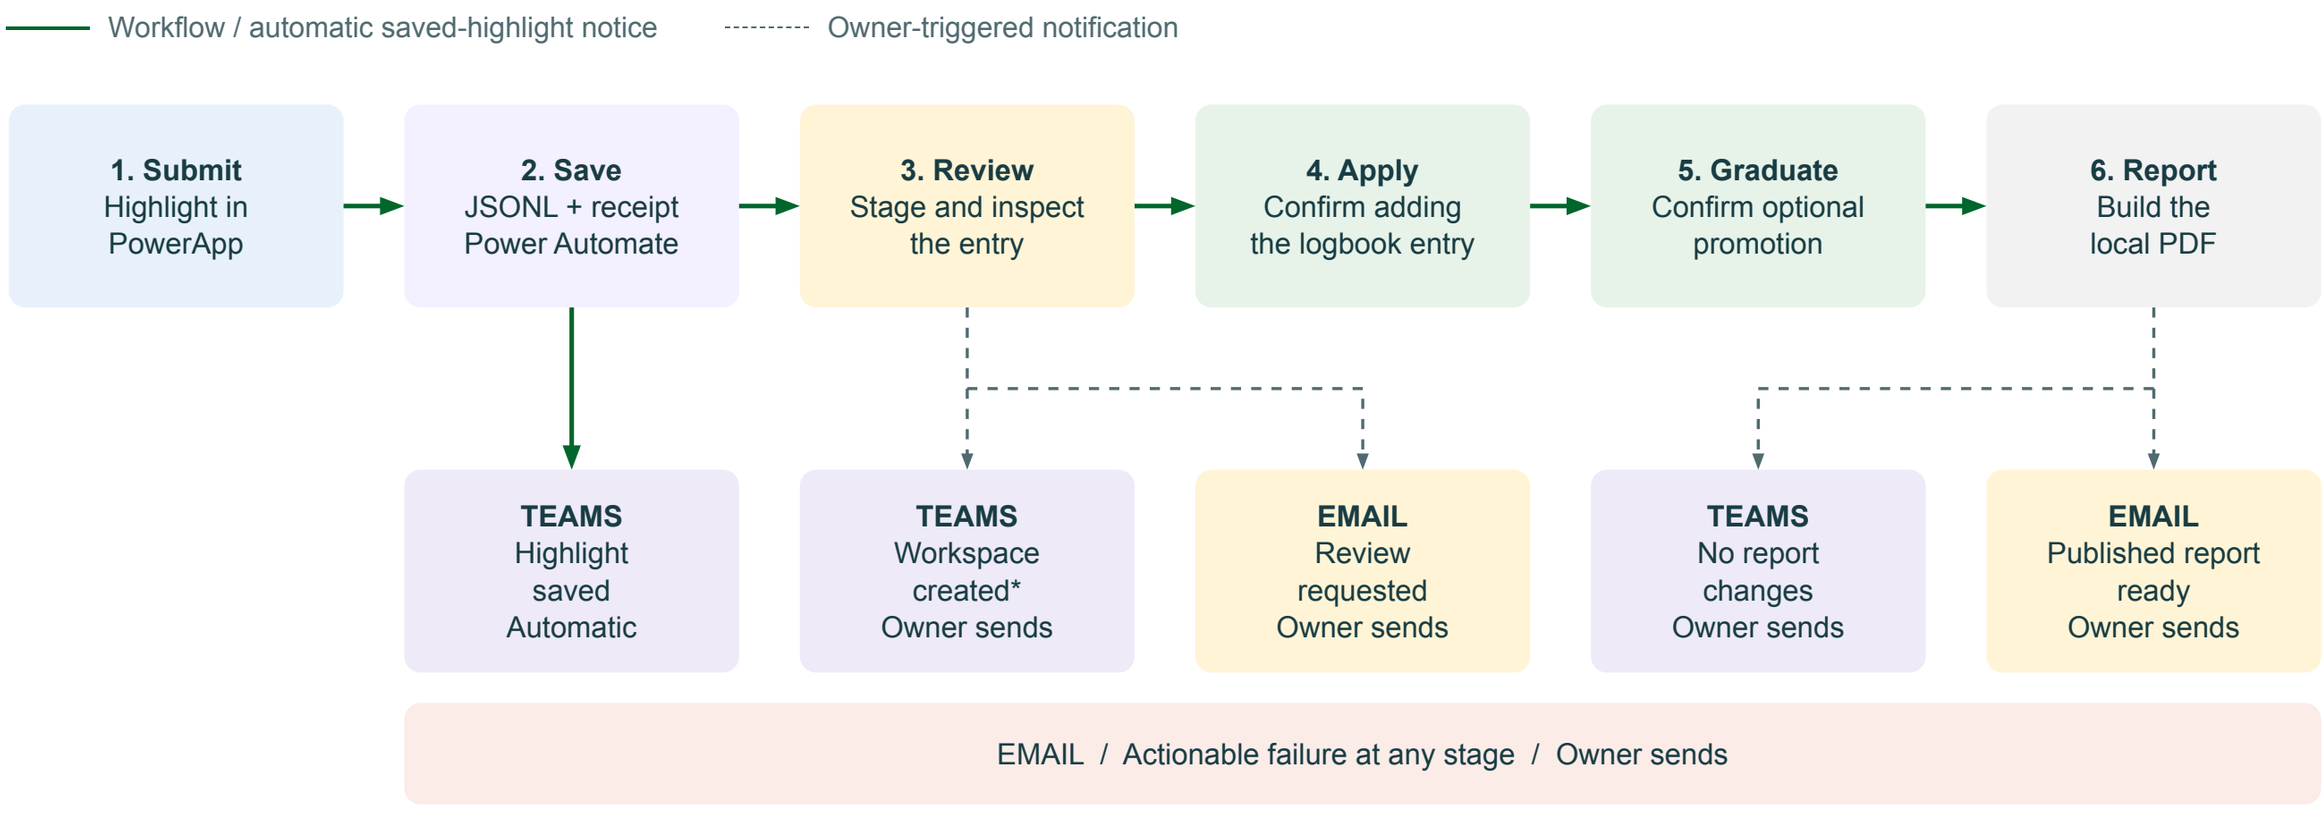

Teams	Saved highlight; review workspace created; no report changes.
Email	Review requested; completed report available; failure needing attention.
App only	Required-field guidance, saving progress, rejected input, and uncertain results.

Updates currently go to Jason: routine notices in his Teams self-chat and milestones by email. Callback milestones are started manually by the owner; Vergil automation is still future work. This update supersedes older notification descriptions in the dated evidence pages that follow.

CURRENT WORKFLOW / CONTRIBUTOR AND REVIEWER

From Highlight to Report: Who Gets Notified

Follow one highlight through capture, human review and reporting. Notifications mark progress; the GitLab receipt and reviewed records remain the evidence.

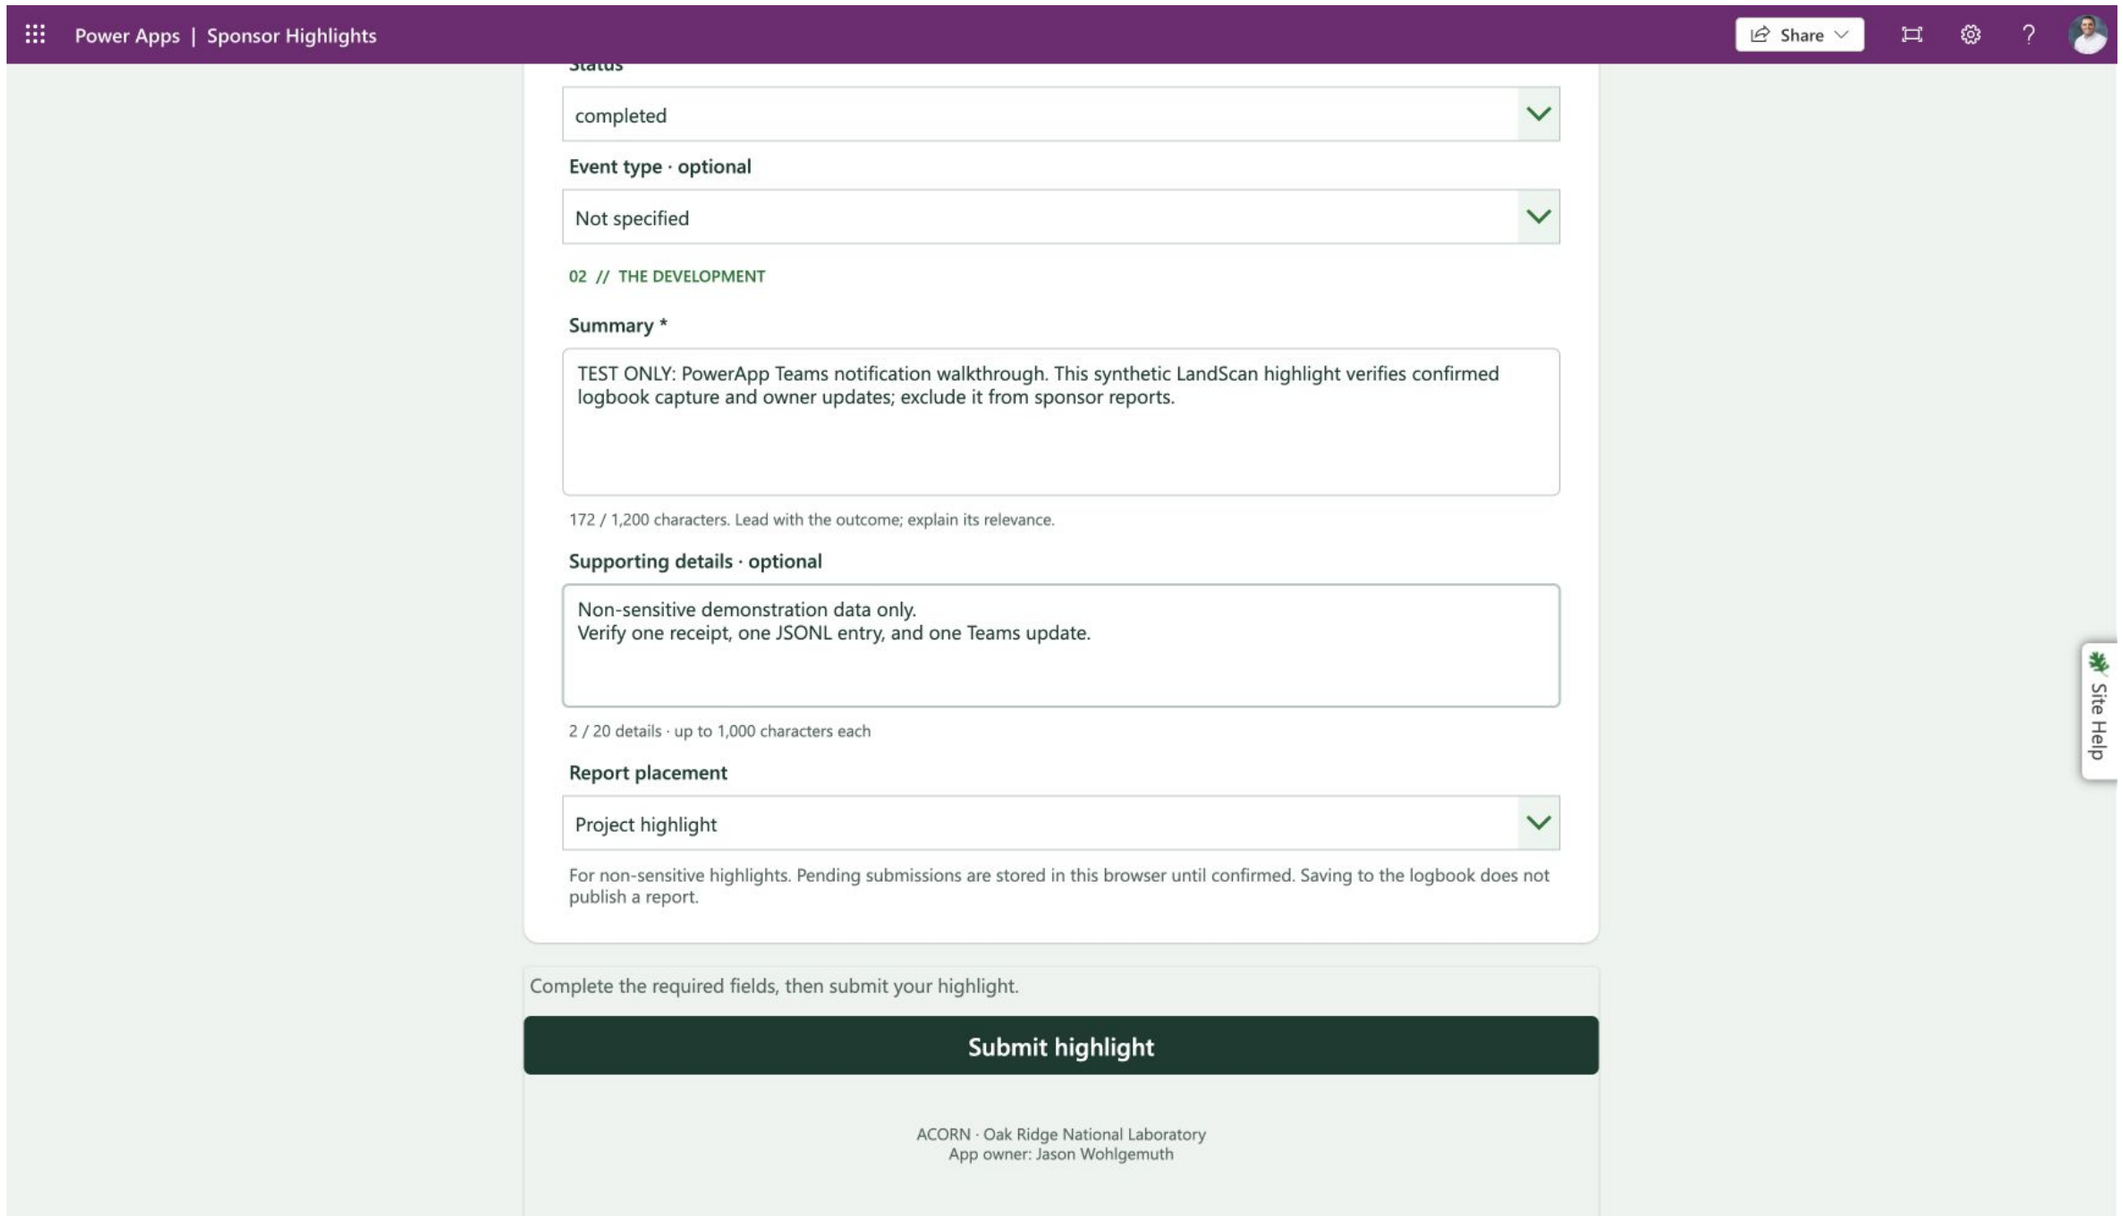

Review stays human. Apply and graduation use separate Yes / No confirmations. Promotion is optional and depends on the entry. *Workspace created refers to an optional GitLab review workspace.

Messages after capture are manual today. The local CLI does not send them. The owner records the actual milestone in Power Automate. A local PDF alone does not trigger a published-report email.

Current recipient: Jason Wohlgemuth Teams self-chat for routine updates; email for review requests, published reports and actionable failures. Exact replays send no new notice.

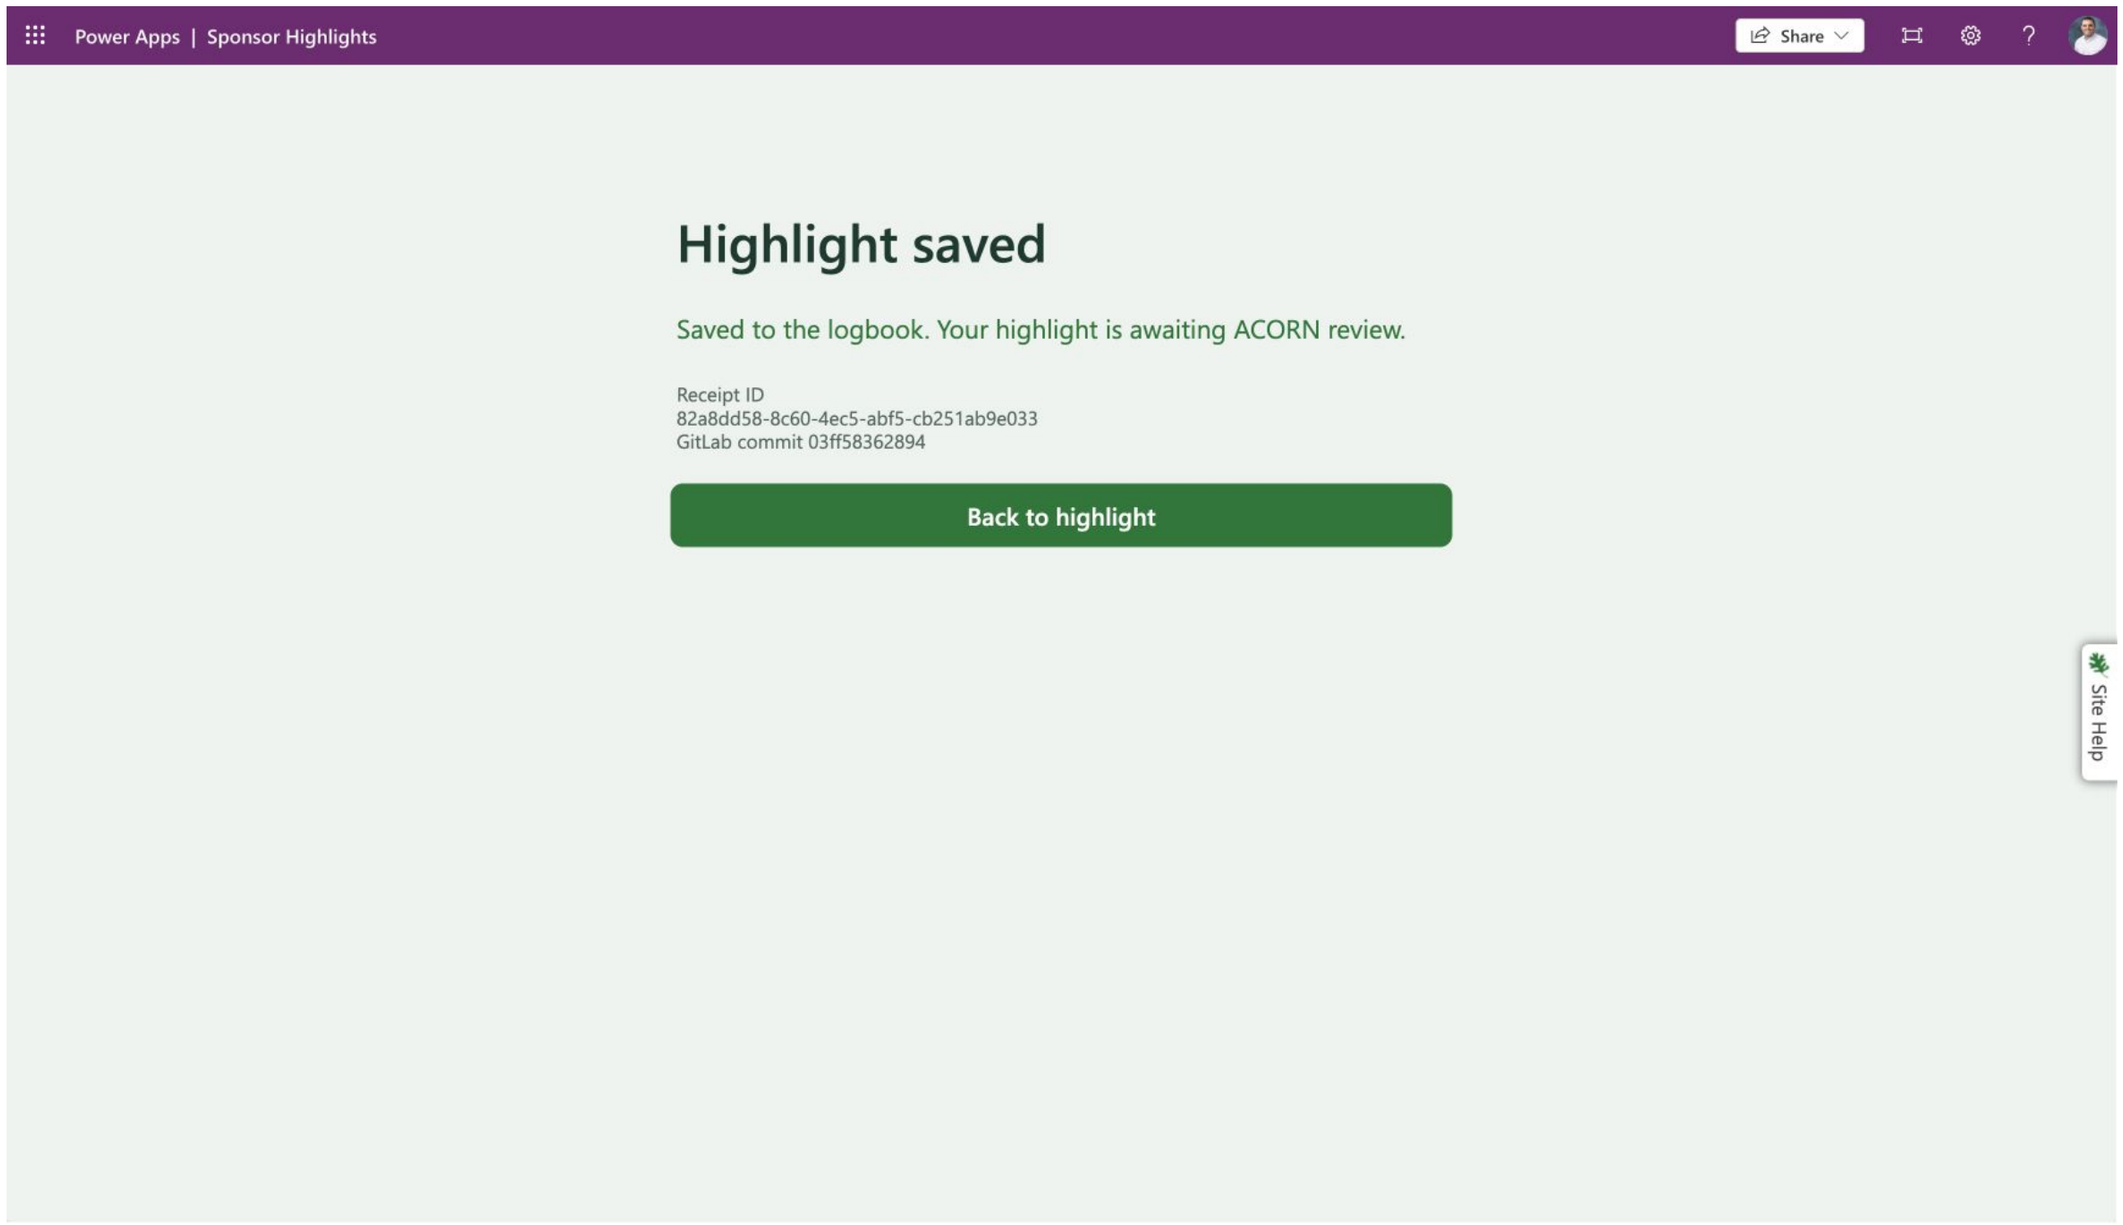

CURRENT WORKFLOW / CONTRIBUTOR

1. Write a focused highlight

The live catalog includes the imported NGA projects. Required fields enable Submit highlight. This LandScan example is synthetic and must stay out of sponsor reports.

2. Wait for the confirmed receipt

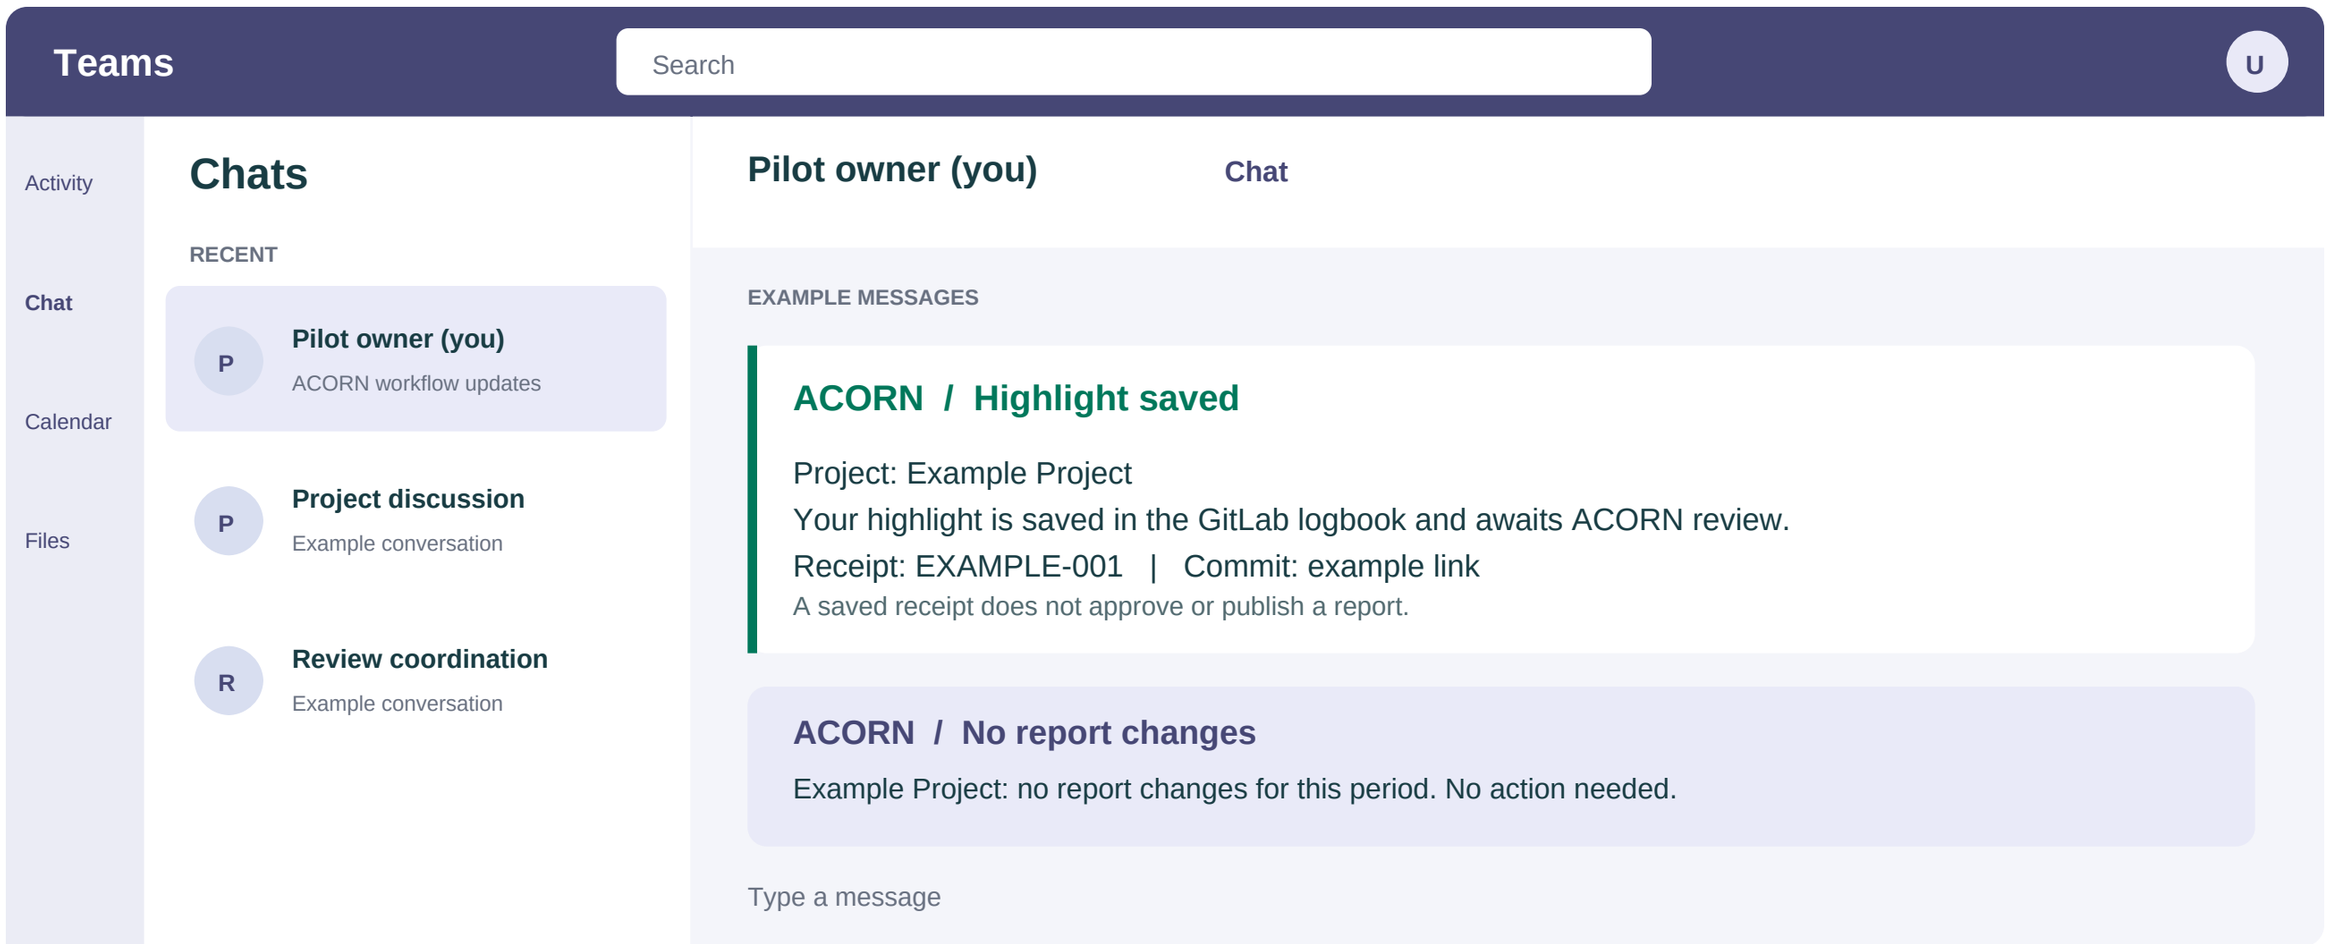

The app confirmed receipt 82a8dd58-8c60-4ec5-abf5-cb251ab9e033 at commit 03ff58362894. If the outcome is uncertain, keep the pending submission and retry its existing receipt instead of starting another.

CURRENT WORKFLOW / OWNER AND REVIEWER

3. Follow routine updates in Teams

ILLUSTRATIVE EXAMPLE

Fictional chats and messages; no personal information from the original screenshot.

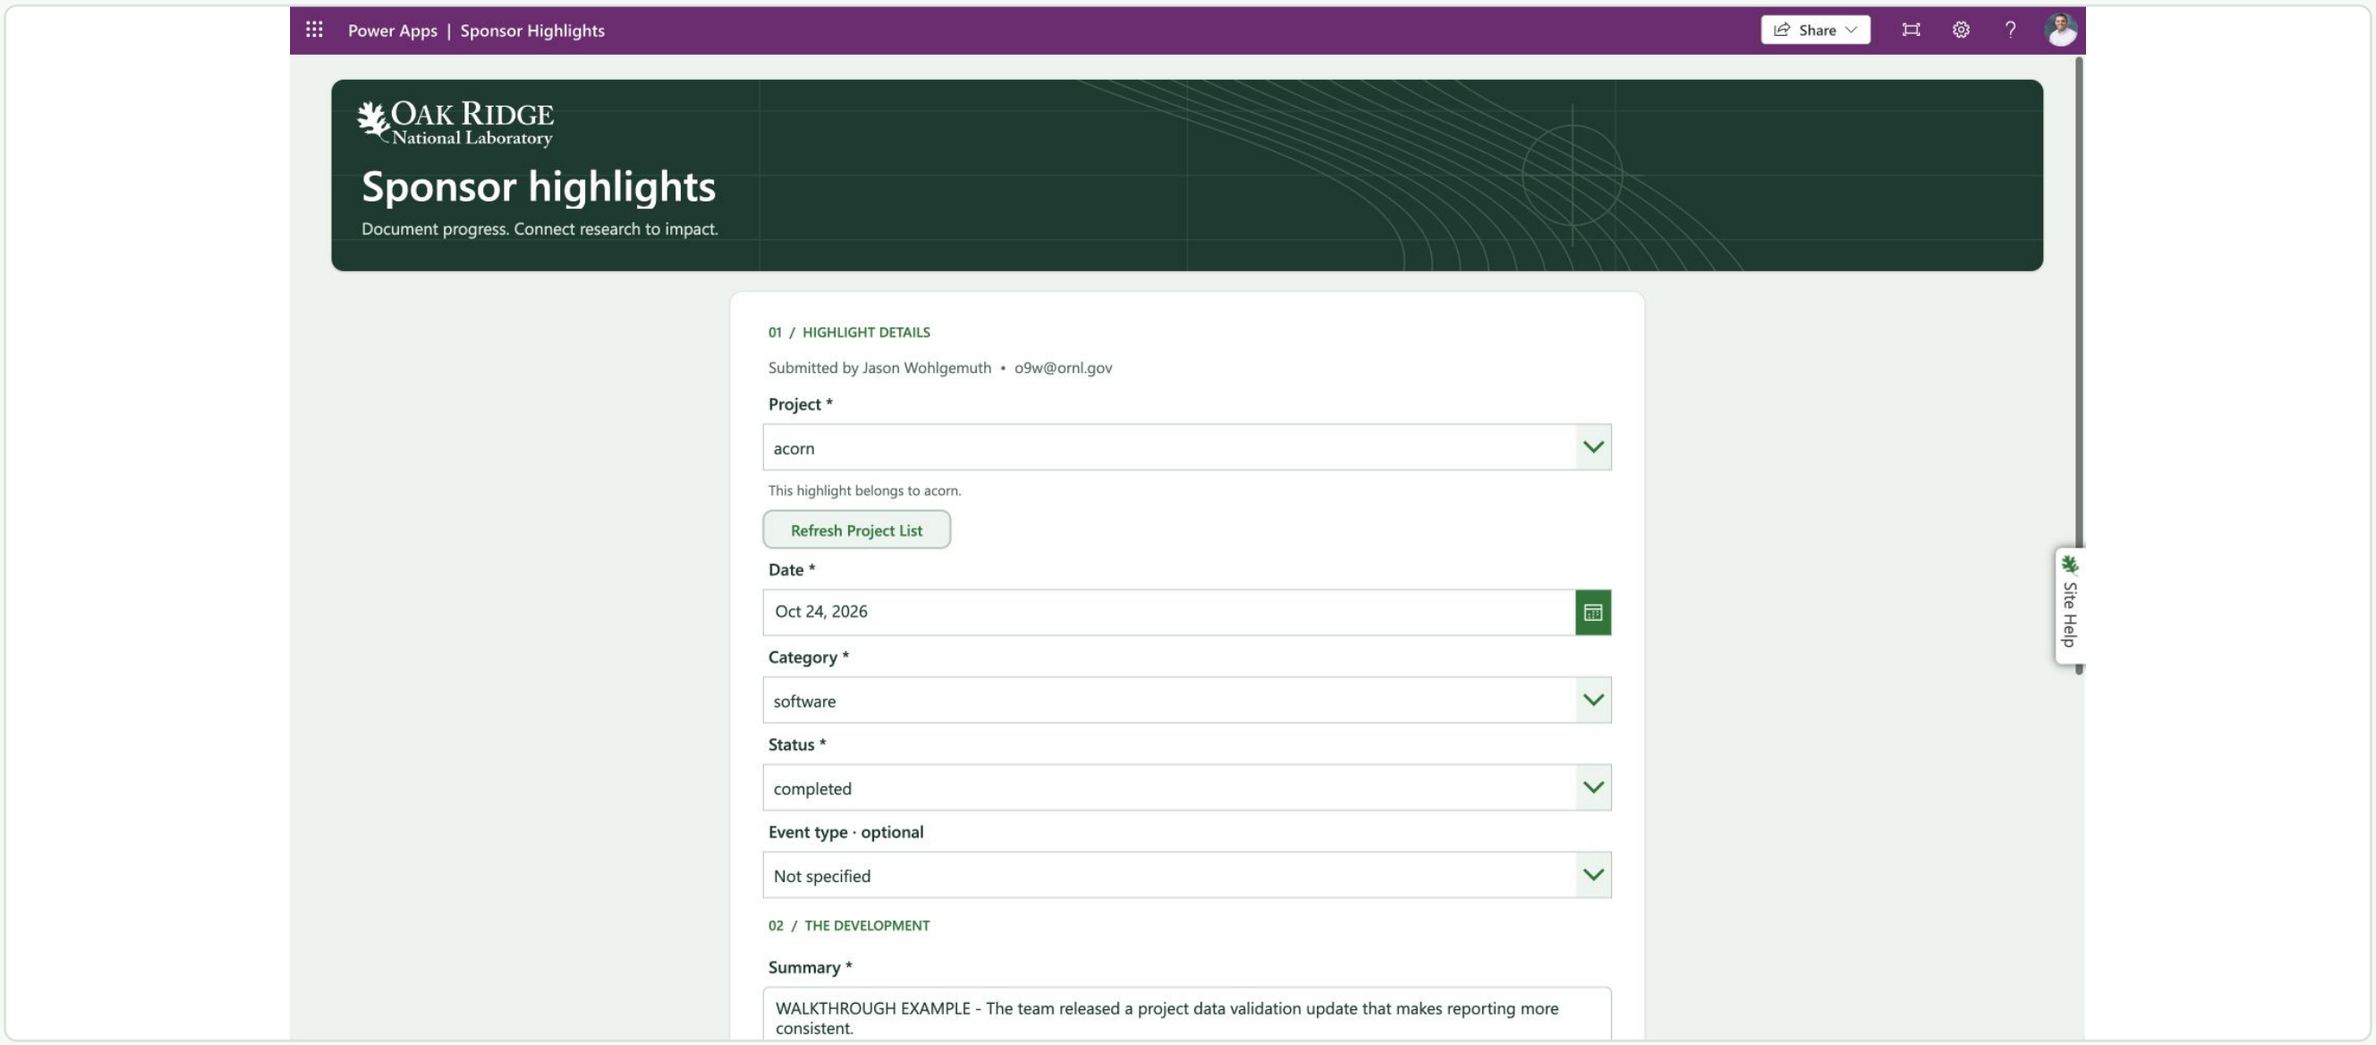

Teams carries routine progress updates. A saved-highlight notice includes the project, receipt and commit link. Review requests, published-report milestones and actionable failures use email.

Sponsor Highlights: user guide

A screenshot walkthrough for contributors and reviewers: enter a non-sensitive highlight, confirm its save, recover an interrupted submission, and understand the later review handoff.

1. Current pilot: Wohlgemuth, Jason. Operational owner and initial notification recipient: Jason Wohlgemuth (o9w@ornl.gov).

2. This guide uses the published form and controlled test evidence from October 24, 2026. Examples are synthetic and excluded from sponsor reporting.

Current published form. The sample entered for these screenshots was not submitted.

Keep in mind: Saving a highlight queues it in the logbook. ACORN admission, human review, report generation, and a report notification are later steps.

Open Sponsor Highlights

Using this guide

Contributors use the PowerApp. Reviewers assess the submitted content and any review package provided by the owner.

Reader	Pages	Purpose
Contributor	3-15	Choose a project, complete the form, submit, and recover safely.
Reviewer	16-17	Check content and understand review/report notifications.
Everyone	18-19	Choose the next action and get help.

Keep in mind: Captions distinguish current captures, earlier tests, and behavior still awaiting acceptance. The developer guide contains flow operations, receipt-ledger management, and deployment limits.

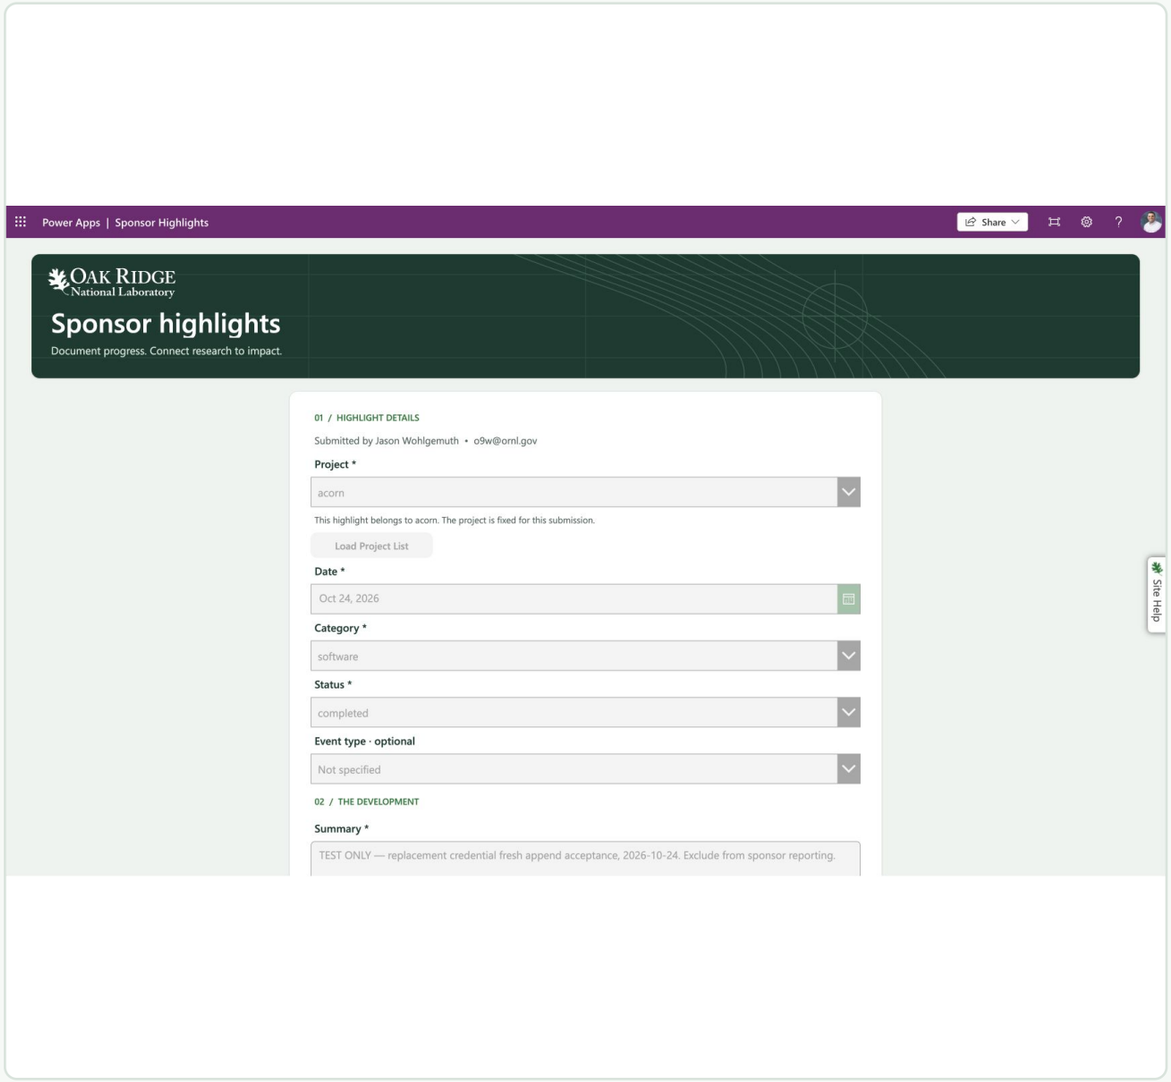

Open the app and load projects

Open the published app in a regular browser window and sign in with the approved ORNL account. Check the Submitted by line before entering a highlight.

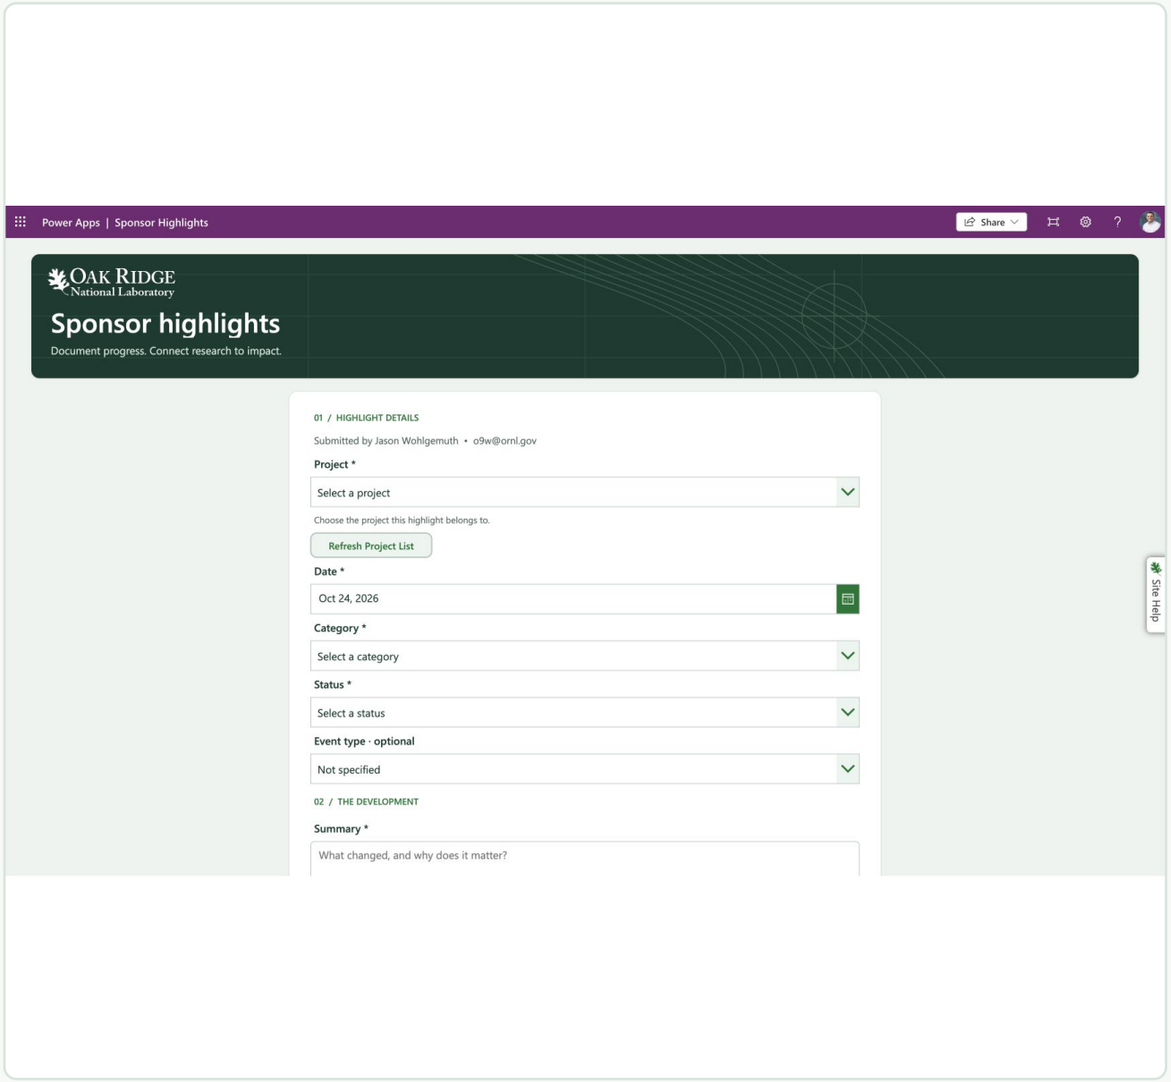

1. On a fresh form, the app may load projects automatically. If needed, select Load Project List.

2. While a request runs, the button says Loading projects... and is unavailable. After success, it says Refresh Project List.

3. Use Refresh Project List when available choices may have changed. A successful load does not itself submit a highlight.

Current published initial label, shown on a recovered saved record. Its controls are intentionally locked.

Current fresh form after automatic loading completed; Refresh Project List is available.

Keep in mind: If no list loads, keep the form and read its status. A successful catalog read does not establish that every later GitLab write will succeed.

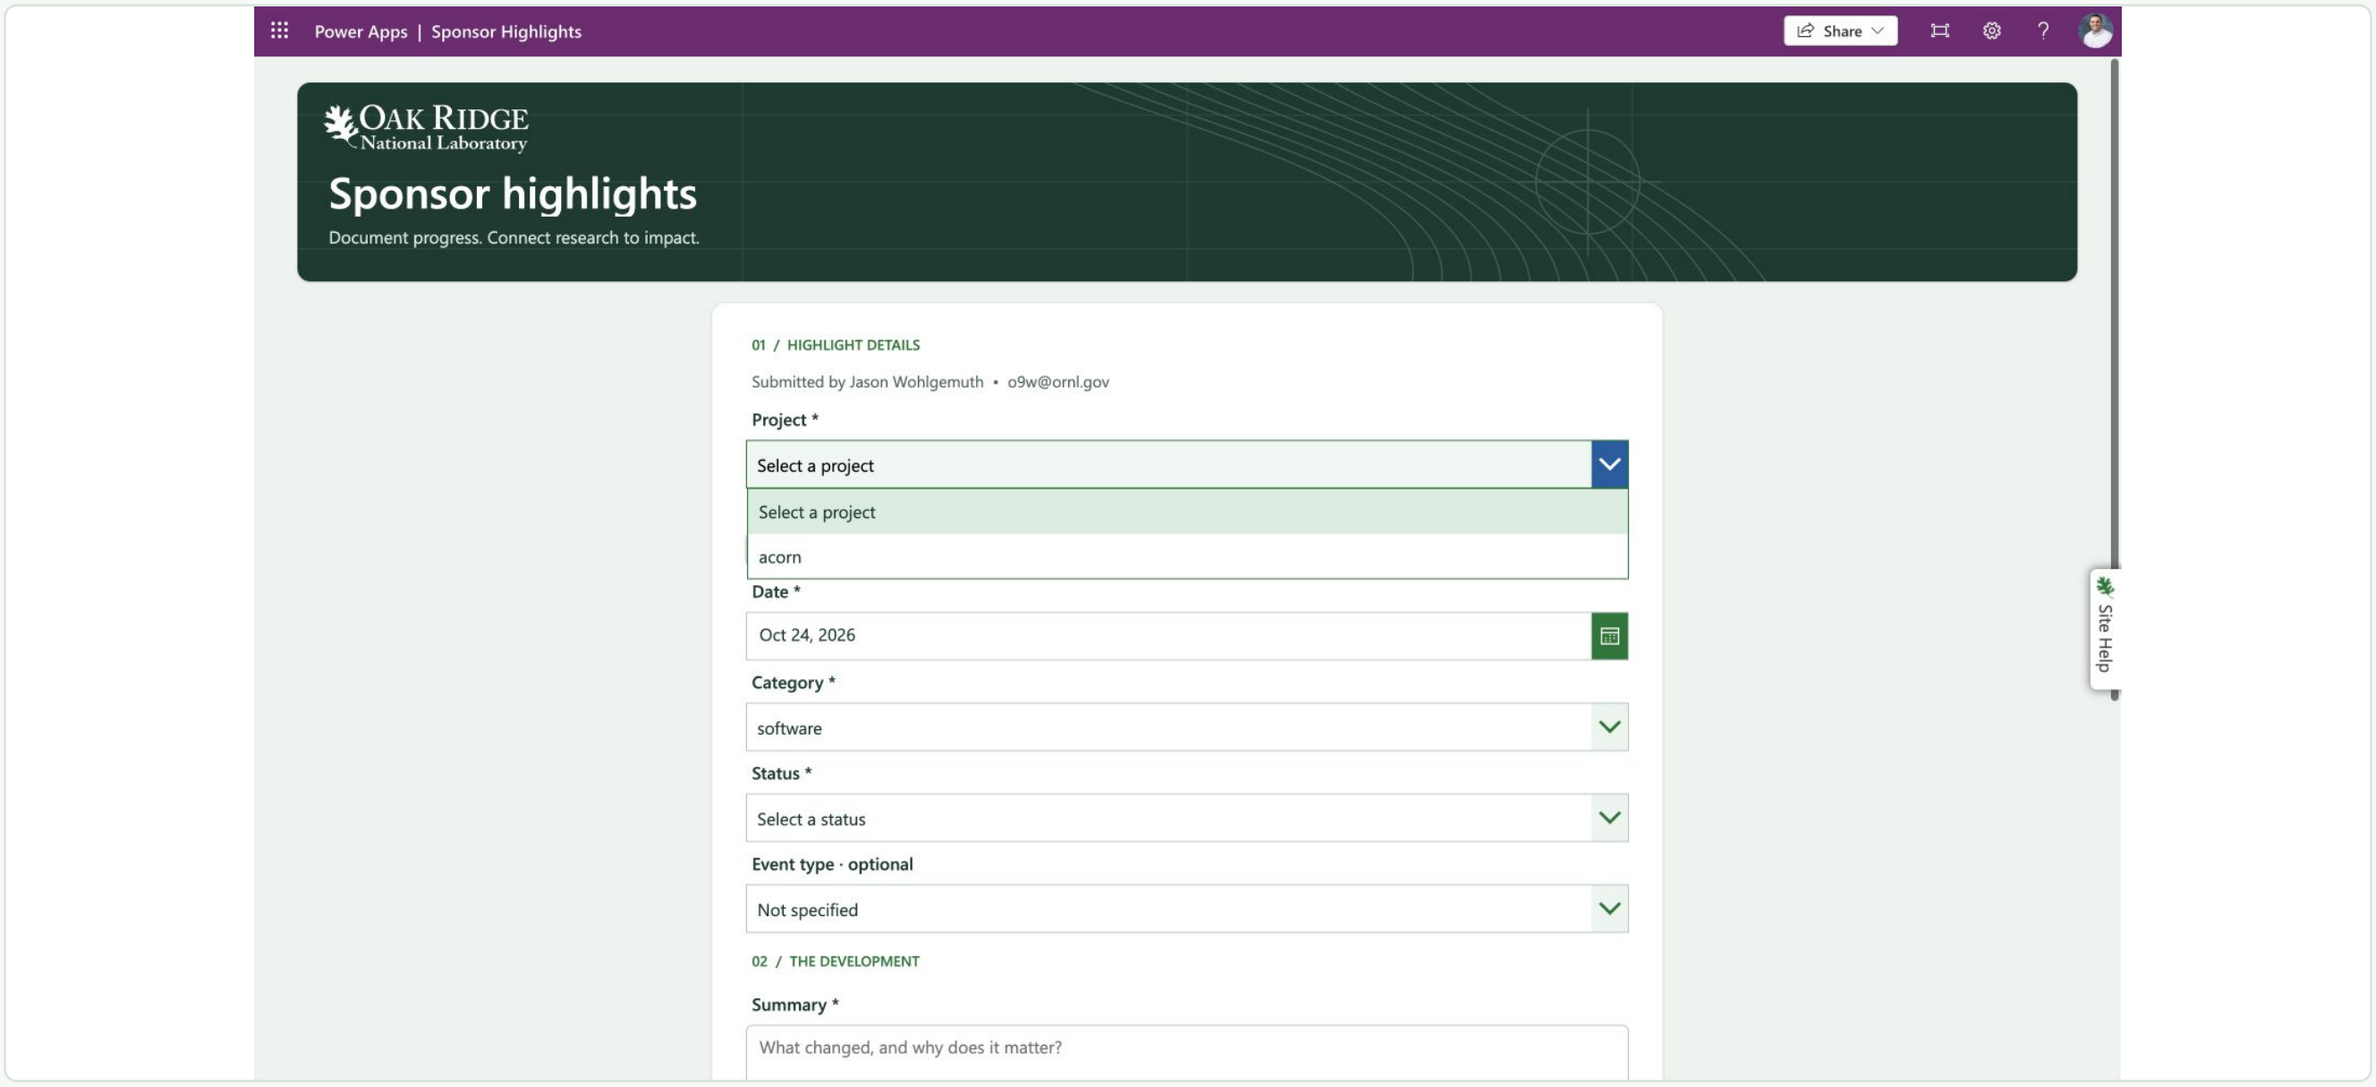

Select the correct project

Open Project and choose the research project that should receive this highlight. The current pilot offers acorn.

1. Choices come from the associated repository; they are not a manually maintained list in the form.

2. An existing .acorn.jsonc folders property is authoritative. Otherwise, discovery finds folders containing index.json or index.yaml.

3. If your project is absent, ask the owner to check the repository configuration. Do not choose an unrelated project as a workaround.

Current capture: the configured acorn project appears in the dropdown.

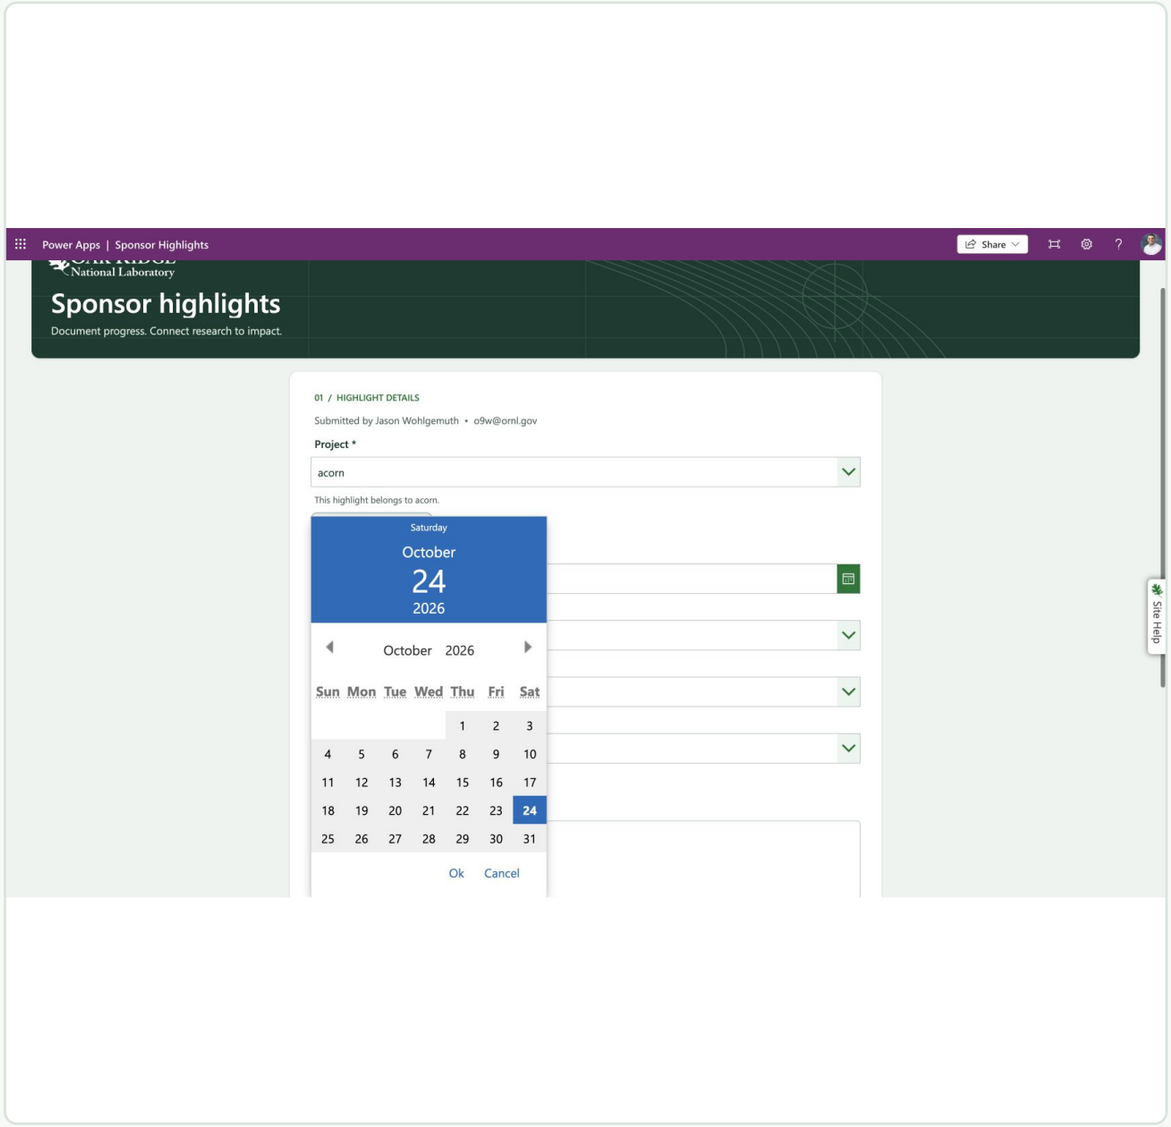

Keep in mind: The selected project becomes fixed when a submission is frozen. Catalog membership and later ACORN authorization are separate checks.

Set the date and category

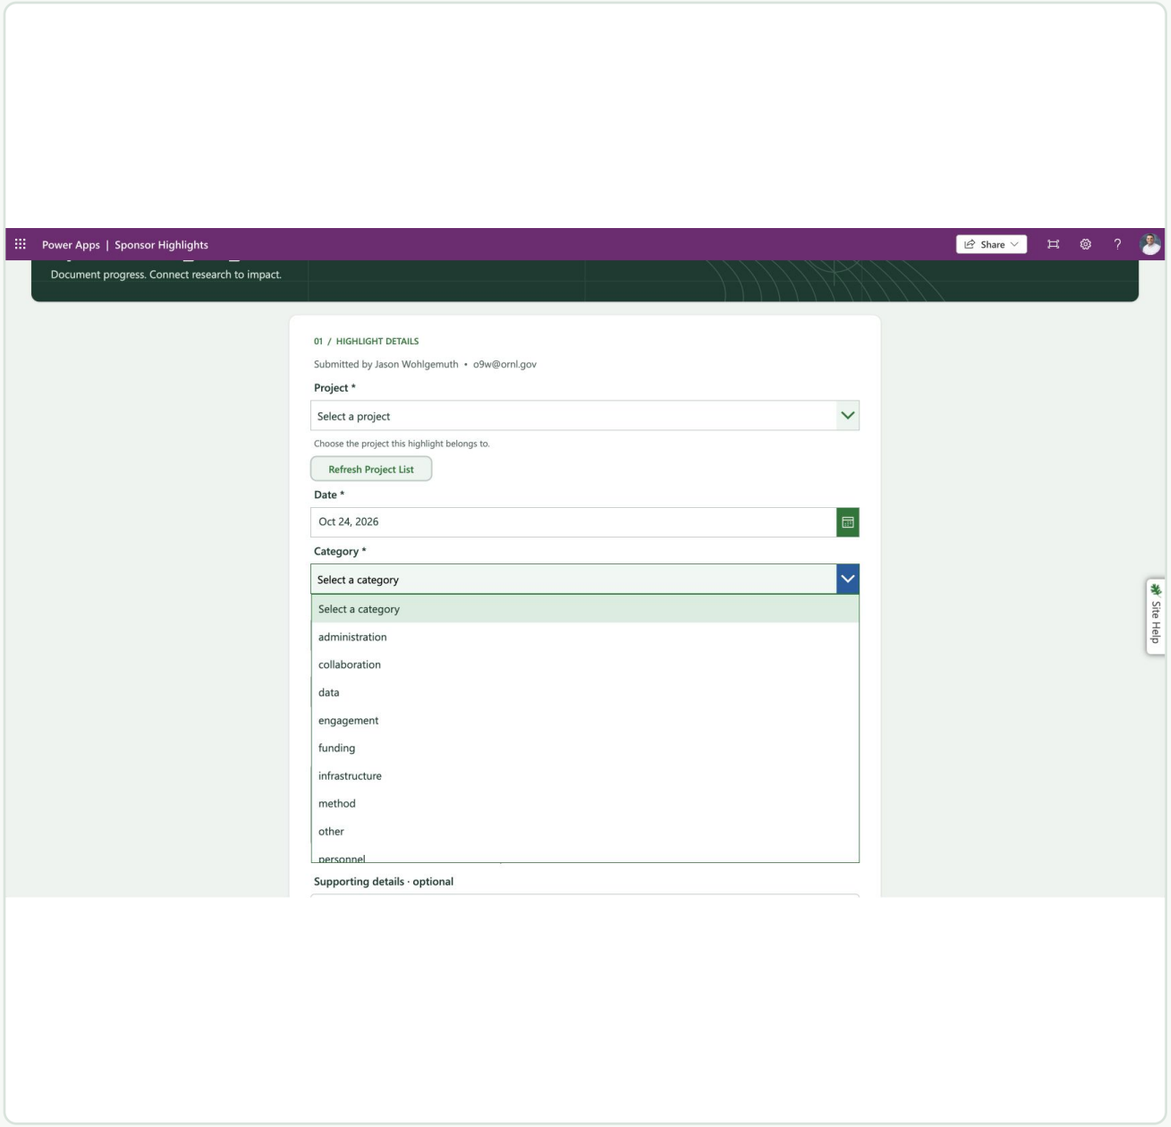

Use the date of the highlight and the category that best describes the work.

1. Open the calendar icon, select a date, and confirm with Ok. Cancel leaves the prior date.

2. Category is required: administration, collaboration, data, engagement, funding, infrastructure, method, other, personnel, publication, research, or software.

Current capture: calendar selection.

Current capture: category menu; scroll within the menu for choices below the visible area.

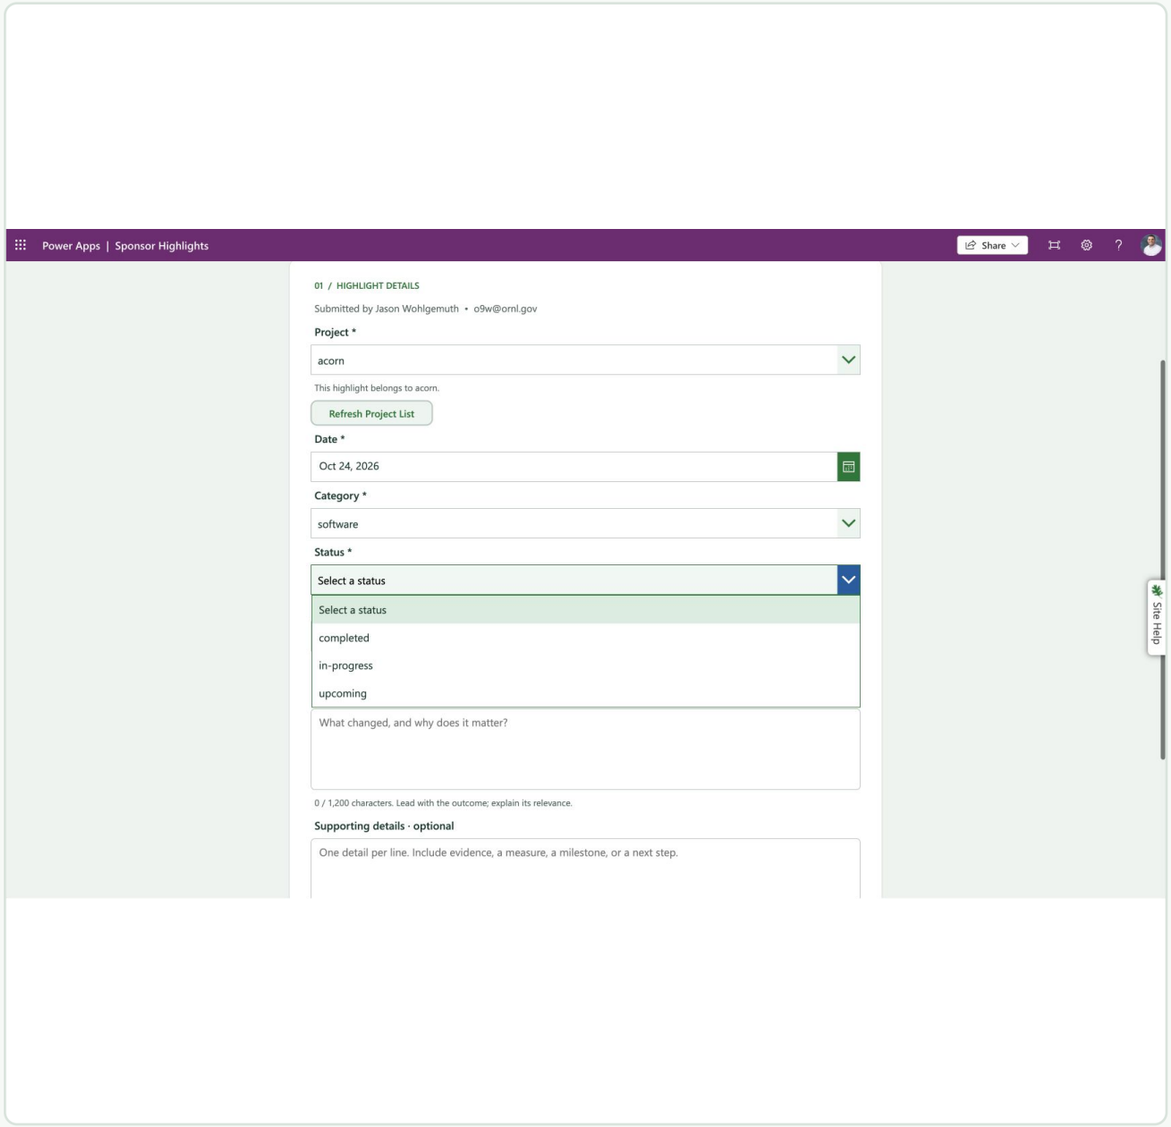

Choose status and optional event type

Status describes progress. Event type describes the occasion when there is one.

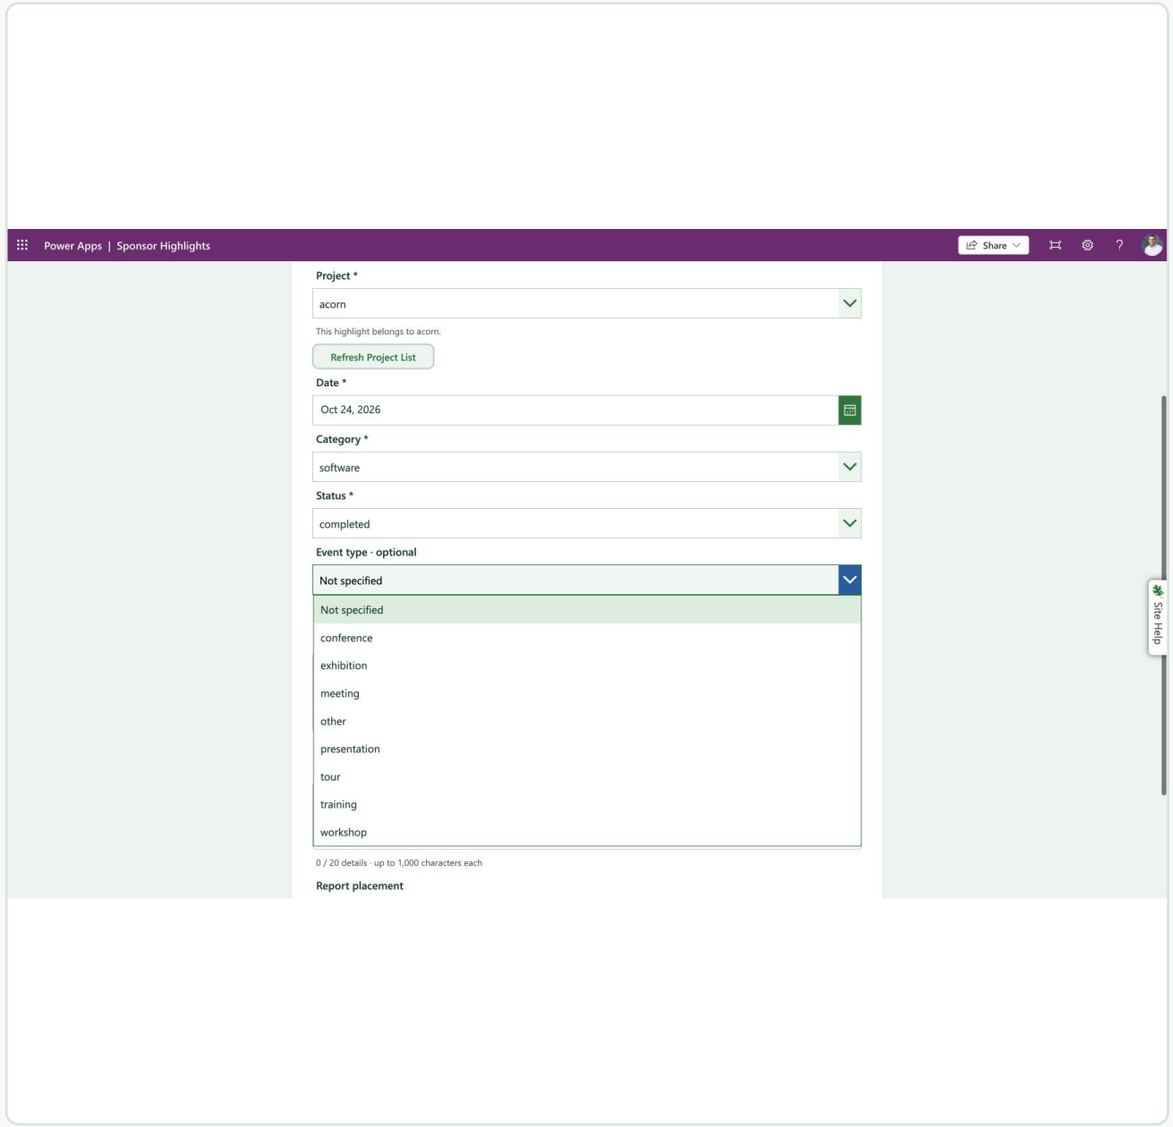

1. Status is required: completed, in-progress, or upcoming.

2. Event type may stay Not specified. Available choices are conference, exhibition, meeting, other, presentation, tour, training, and workshop.

3. Do not invent an event type for a highlight that has no associated event.

Current capture: status choices.

Current capture: optional event types.

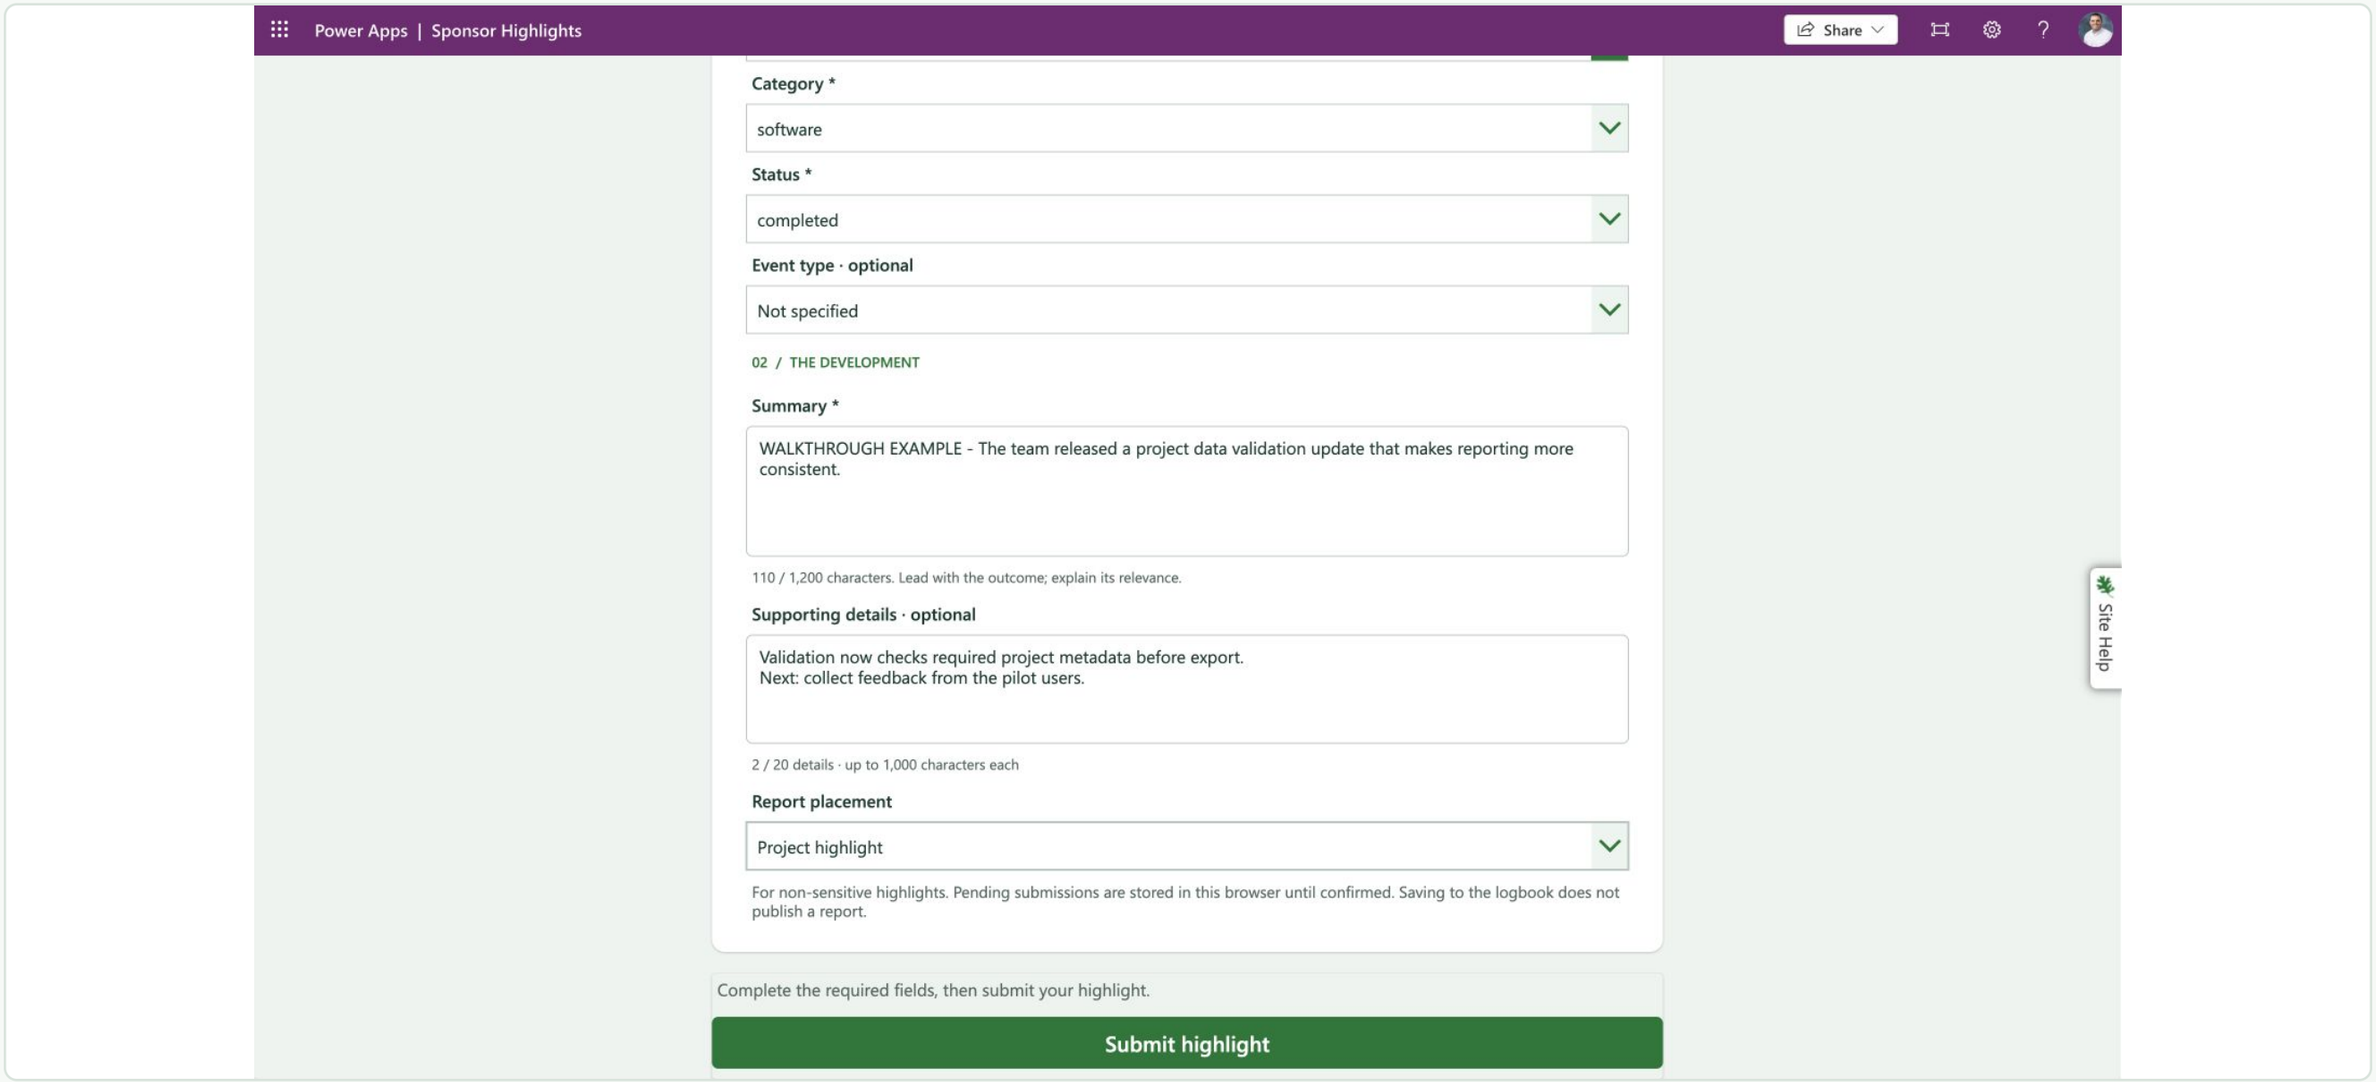

Write the development

Lead the summary with what changed and why it matters. Add concrete evidence or a next step in Supporting details.

1. Summary is required, with a 1,200-character limit. A whitespace-only summary is not sufficient.

2. Supporting details are optional. Enter one detail per line: at most 20 details, each up to 1,000 characters.

3. Watch the counters. Empty optional details are permitted by the form; contributors do not need to construct JSON.

Current capture: an unsent walkthrough example with a summary and two details. Submit highlight is enabled.

Keep in mind: The draft shown here was used only for documentation and was cleared without sending. Avoid sensitive material; pending submissions use local browser storage.

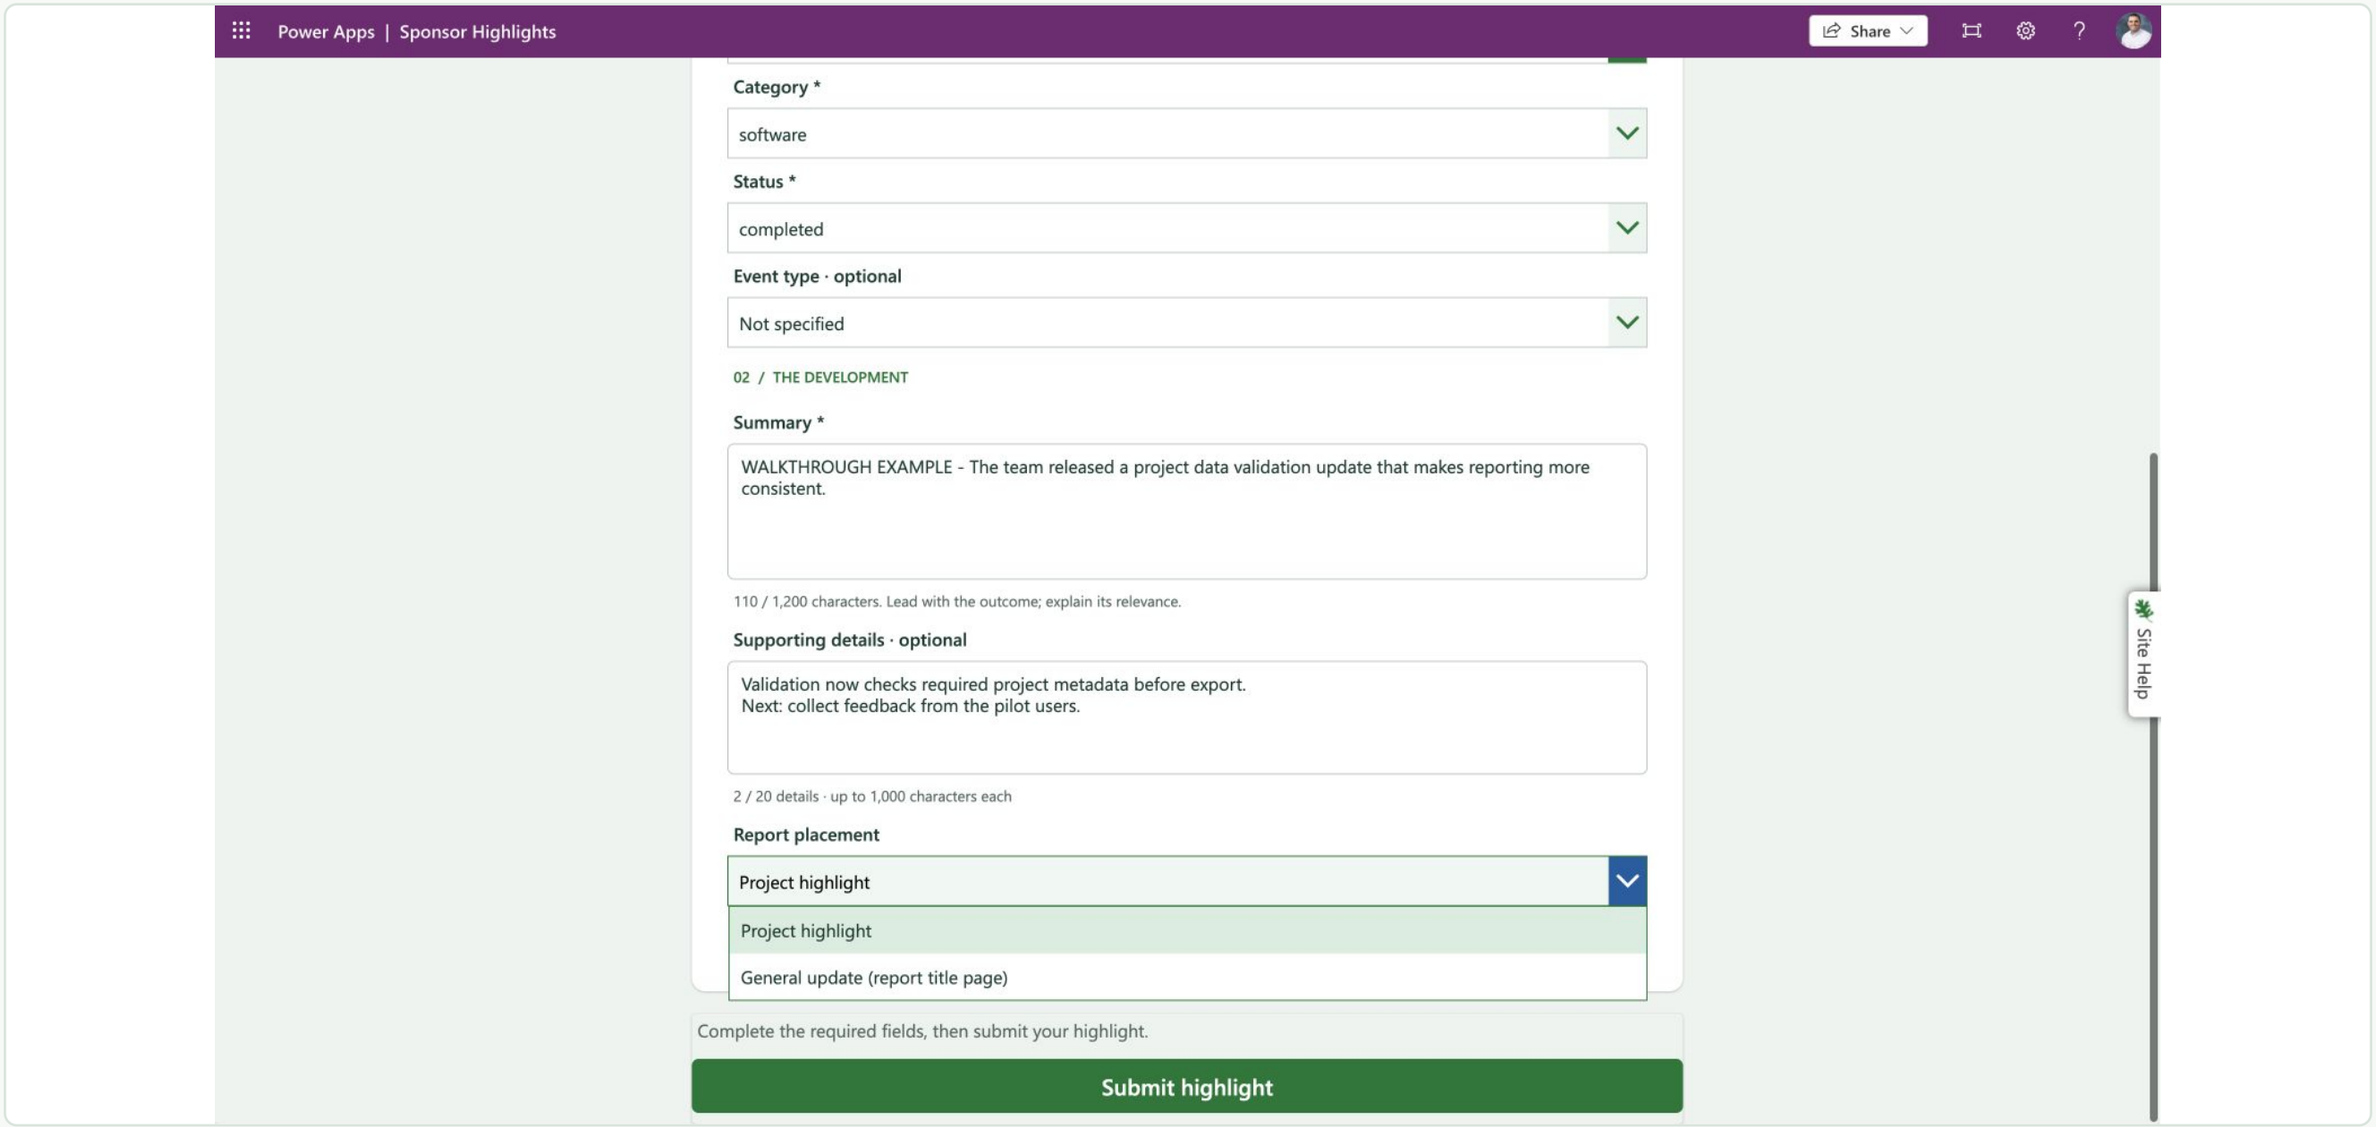

Choose report placement and review

Report placement controls where the highlight is intended to appear after later processing.

1. Project highlight is the normal project-specific choice.

2. General update (report title page) requests general placement. It does not publish or generate a report immediately.

3. Review project, date, category, status, summary, and details. Submit remains unavailable until the form meets its required-field checks.

Current capture: the two report-placement choices.

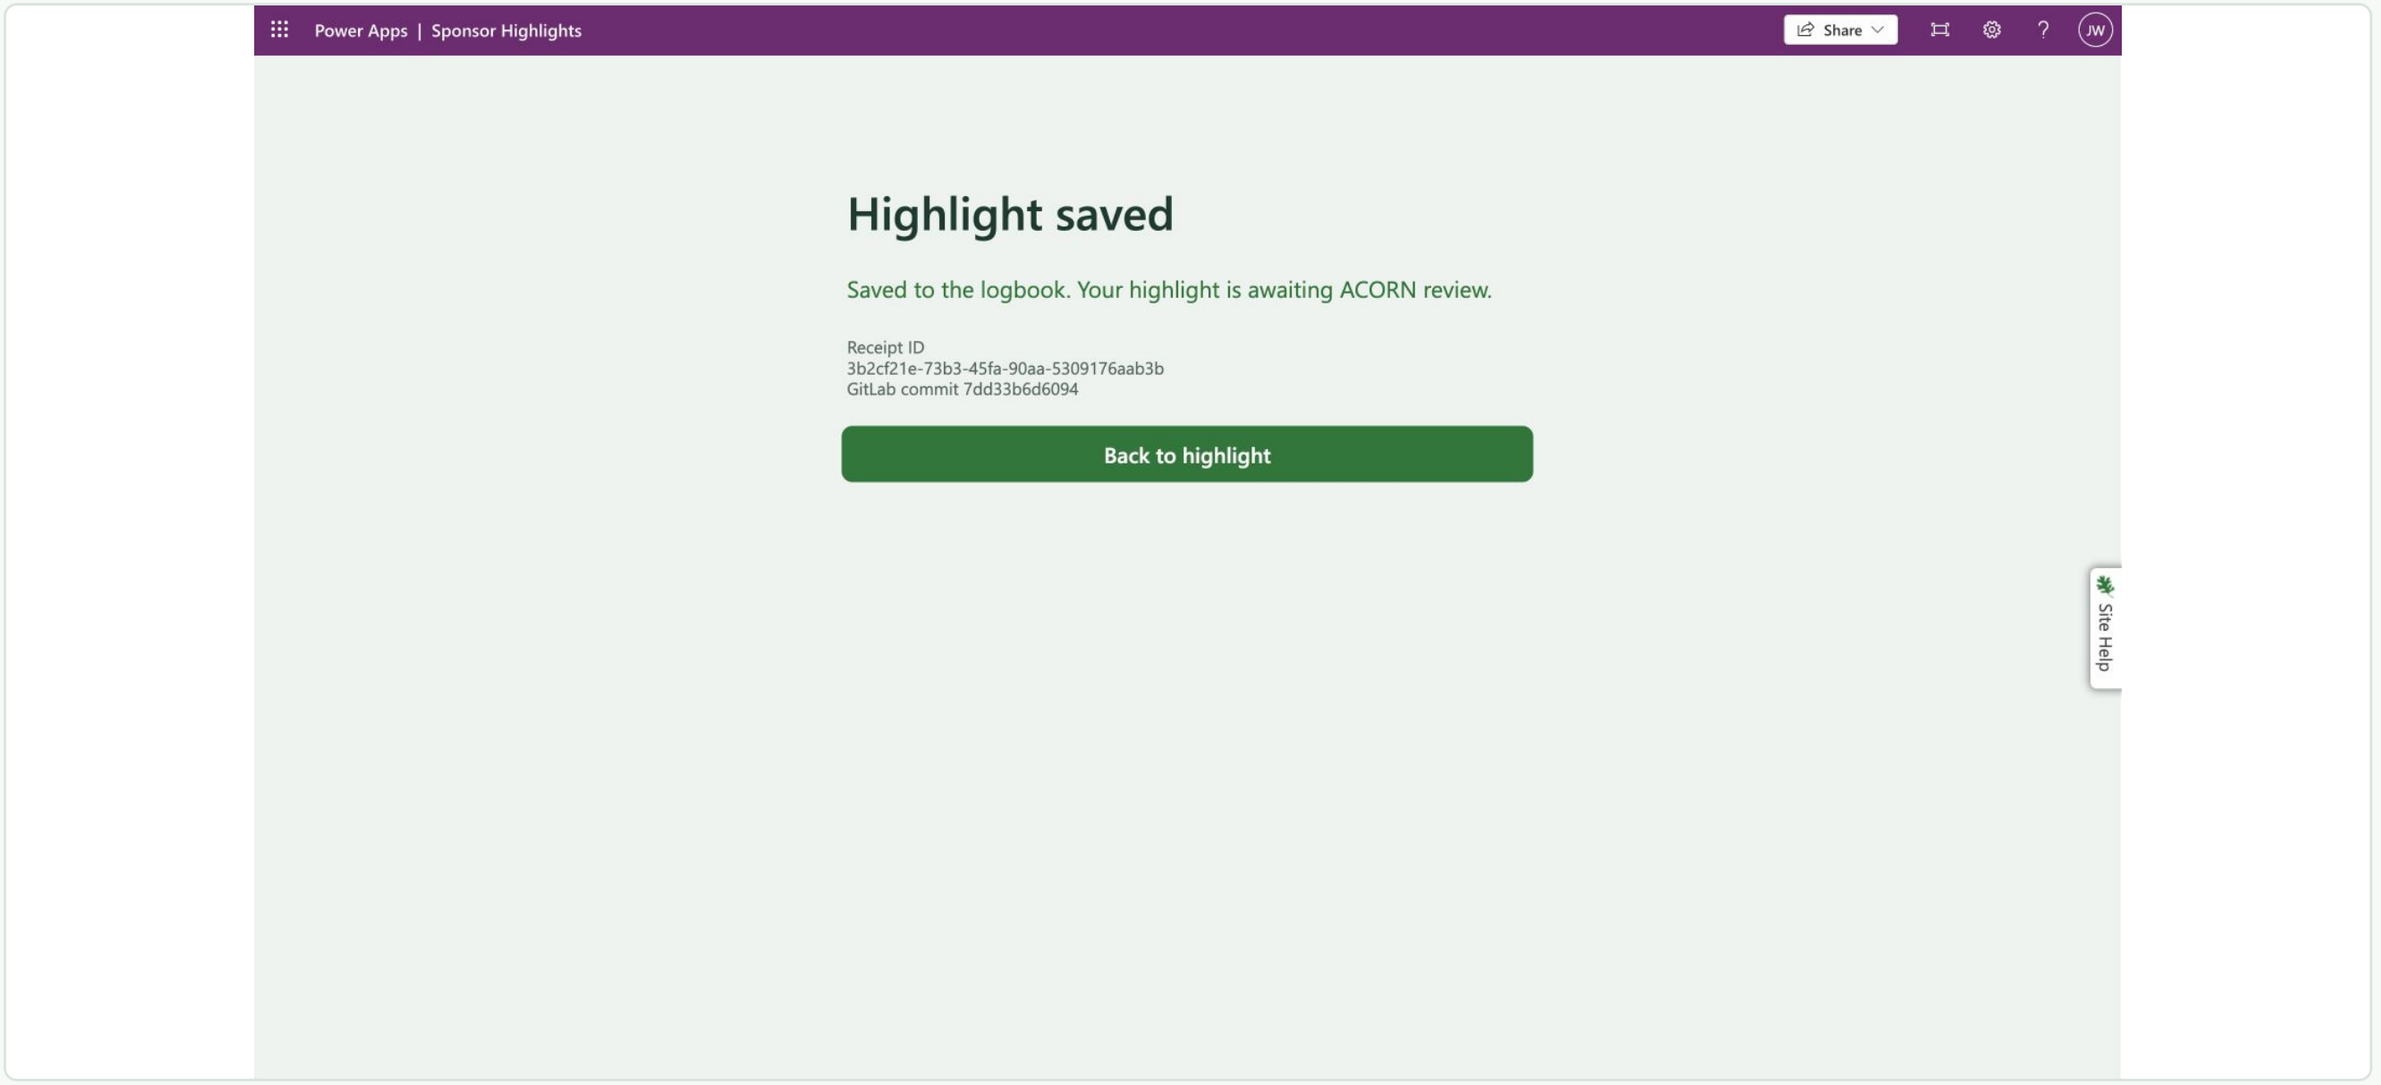

Submit once and read the receipt

Select Submit highlight once. The app freezes the entry, stores the pending submission locally, and invokes the intake flow.

1. While Saving your highlight... is shown, fields and the submit button are locked. Do not open another app tab to submit the same entry.

2. Highlight saved means the flow confirmed a GitLab logbook commit. The result panel shows the receipt ID and commit prefix.

3. Select Back to highlight to return to the preserved entry. Keep the receipt ID if you need help.

Verified published acceptance: matching receipt for submission 3b2cf21e-73b3-45fa-90aa-5309176aab3b and commit 7dd33b6d6094.

Keep in mind: A confirmed save means queued in GitLab. It does not mean a person has reviewed it or that a report or notification has been produced.

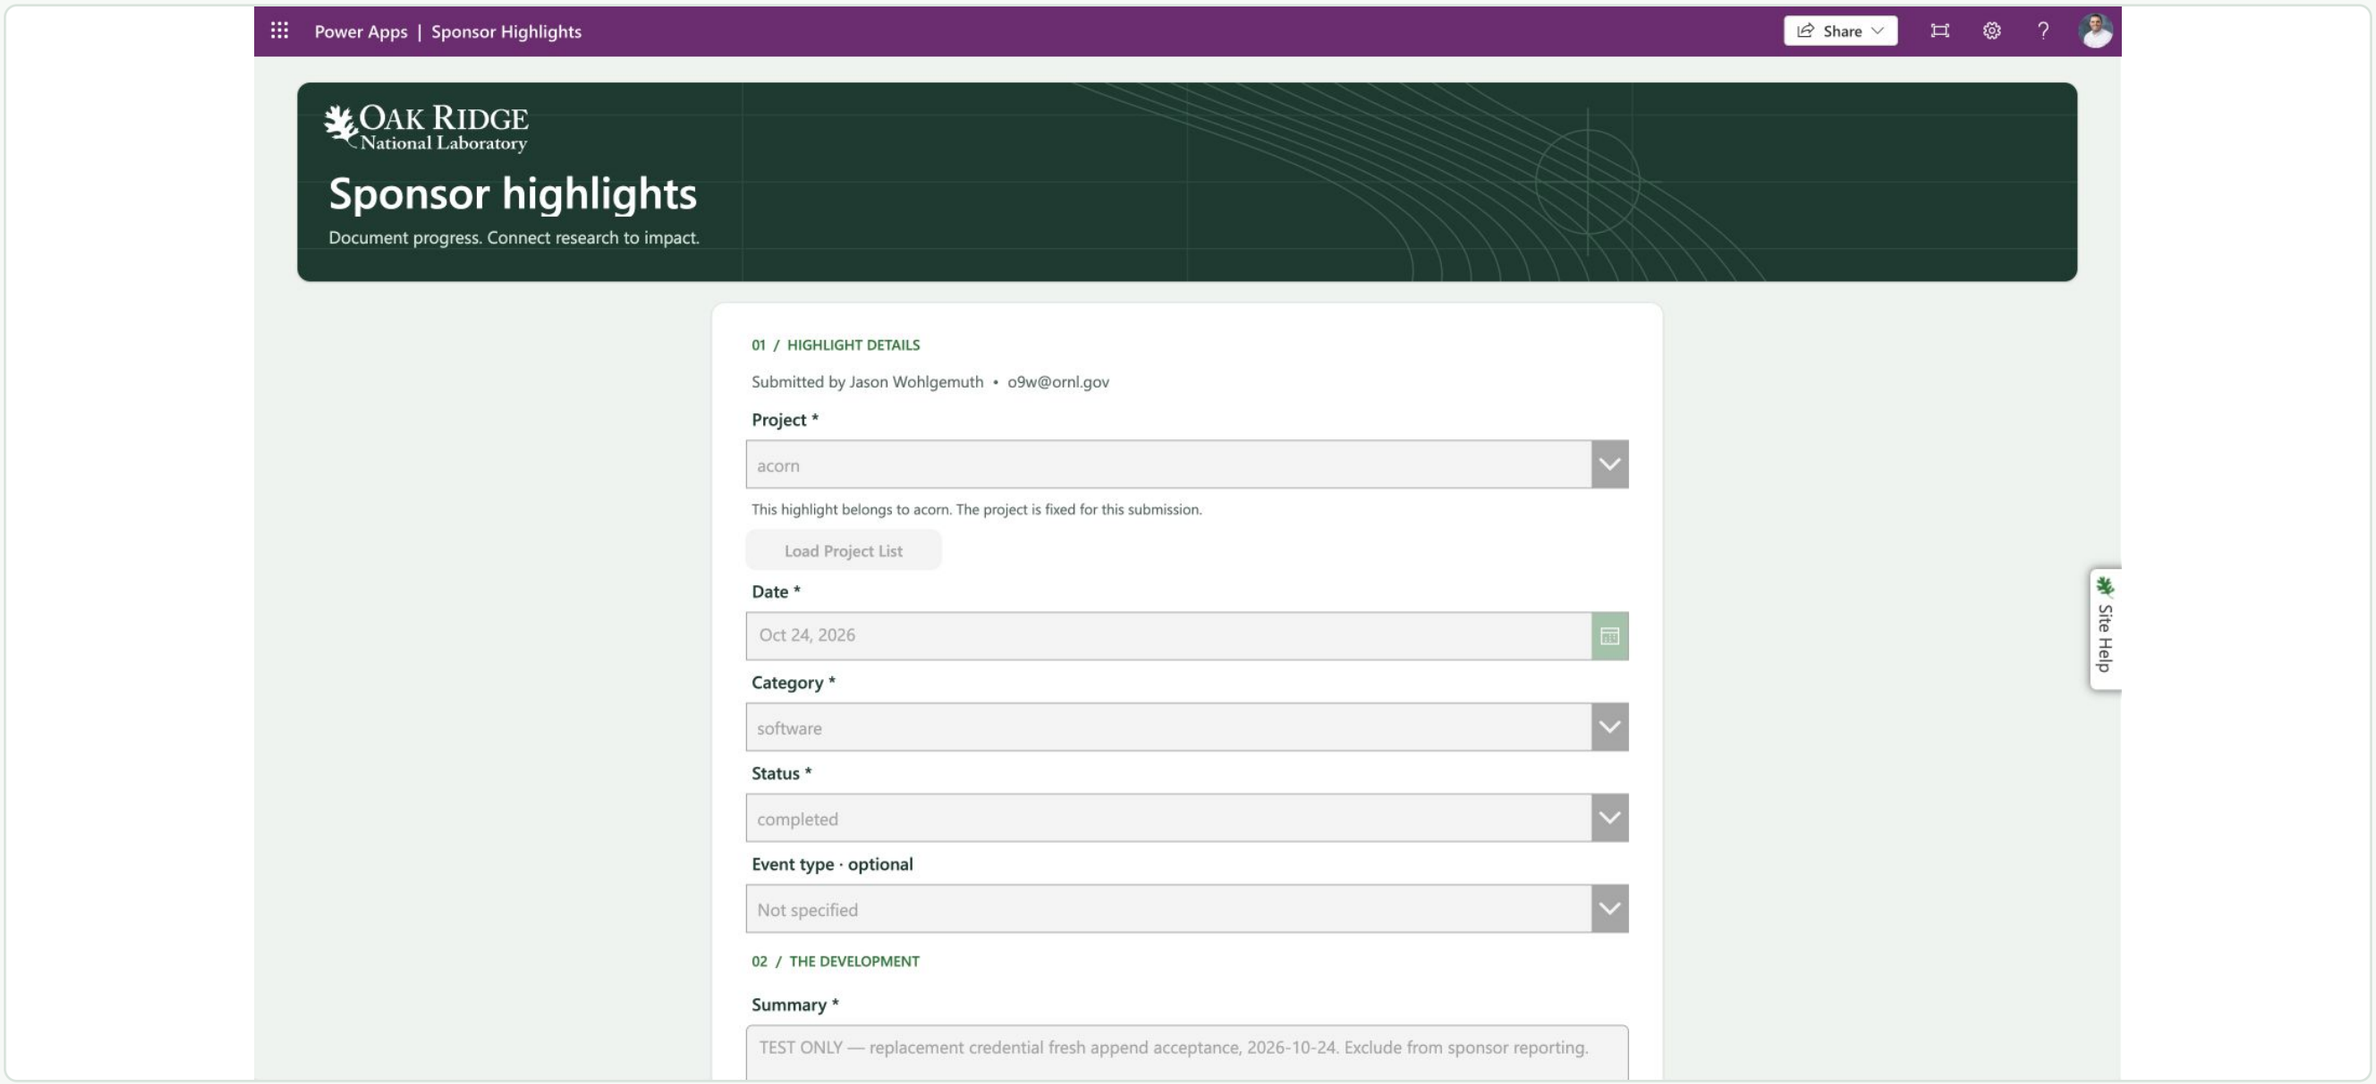

Return to a saved highlight

The app retains the confirmed receipt and locks the fields for that submission. Reload restores the saved result when browser recovery is available.

1. Use Back to highlight to inspect the entry without invoking intake again.

2. Use New highlight only after you have a confirmed save, or the app explicitly permits a new entry after rejection.

3. New highlight clears the local recovery record and resets the form. It does not delete the GitLab logbook record.

Current capture: saved fields remain locked. The lower part of the form contains the receipt and New highlight action.

Keep in mind: The saved project is fixed. A Load Project List label may appear disabled on a recovered record because that session has not loaded a new catalog.

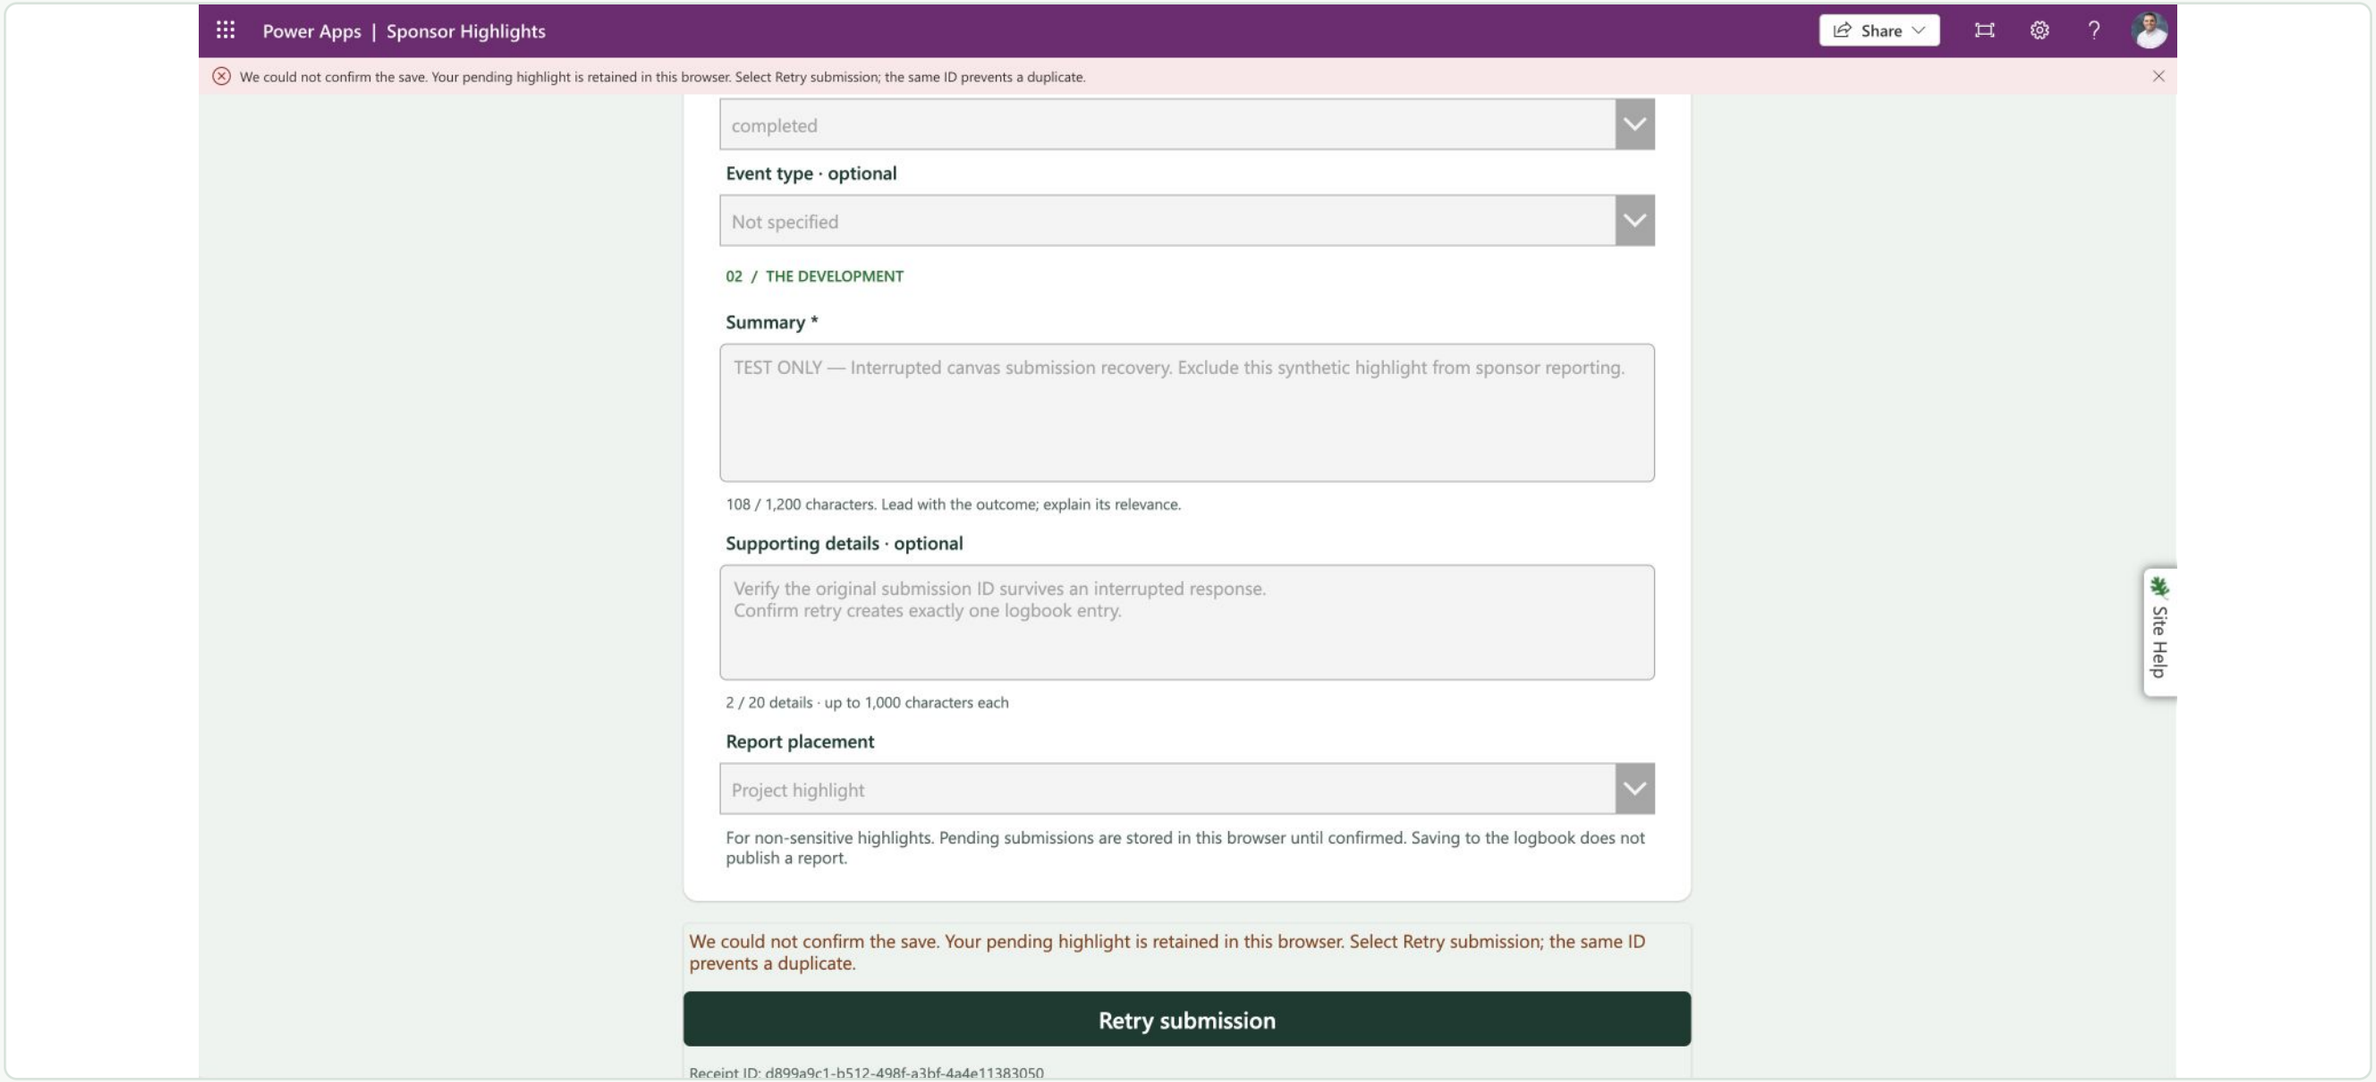

Recover an interrupted submission

If the browser closes or a response is lost, a save may already have reached GitLab. The app keeps the same frozen submission for reconciliation.

1. Reopen the published app in the same browser profile and account. Check the restored fields and receipt ID.

2. Choose Retry submission. Keep the original ID and content; the flow checks prior commits before attempting another append.

3. Wait for a confirmed receipt. If it remains unresolved, keep the browser record and contact the owner with the ID and approximate time.

Earlier published acceptance: pending content is preserved and Retry submission is offered. Earlier wording may differ.

Keep in mind: Reload and app-tab closure recovery passed. A full browser-process restart remains an acceptance item. Use one app tab at a time; another browser/device does not carry this local recovery slot.

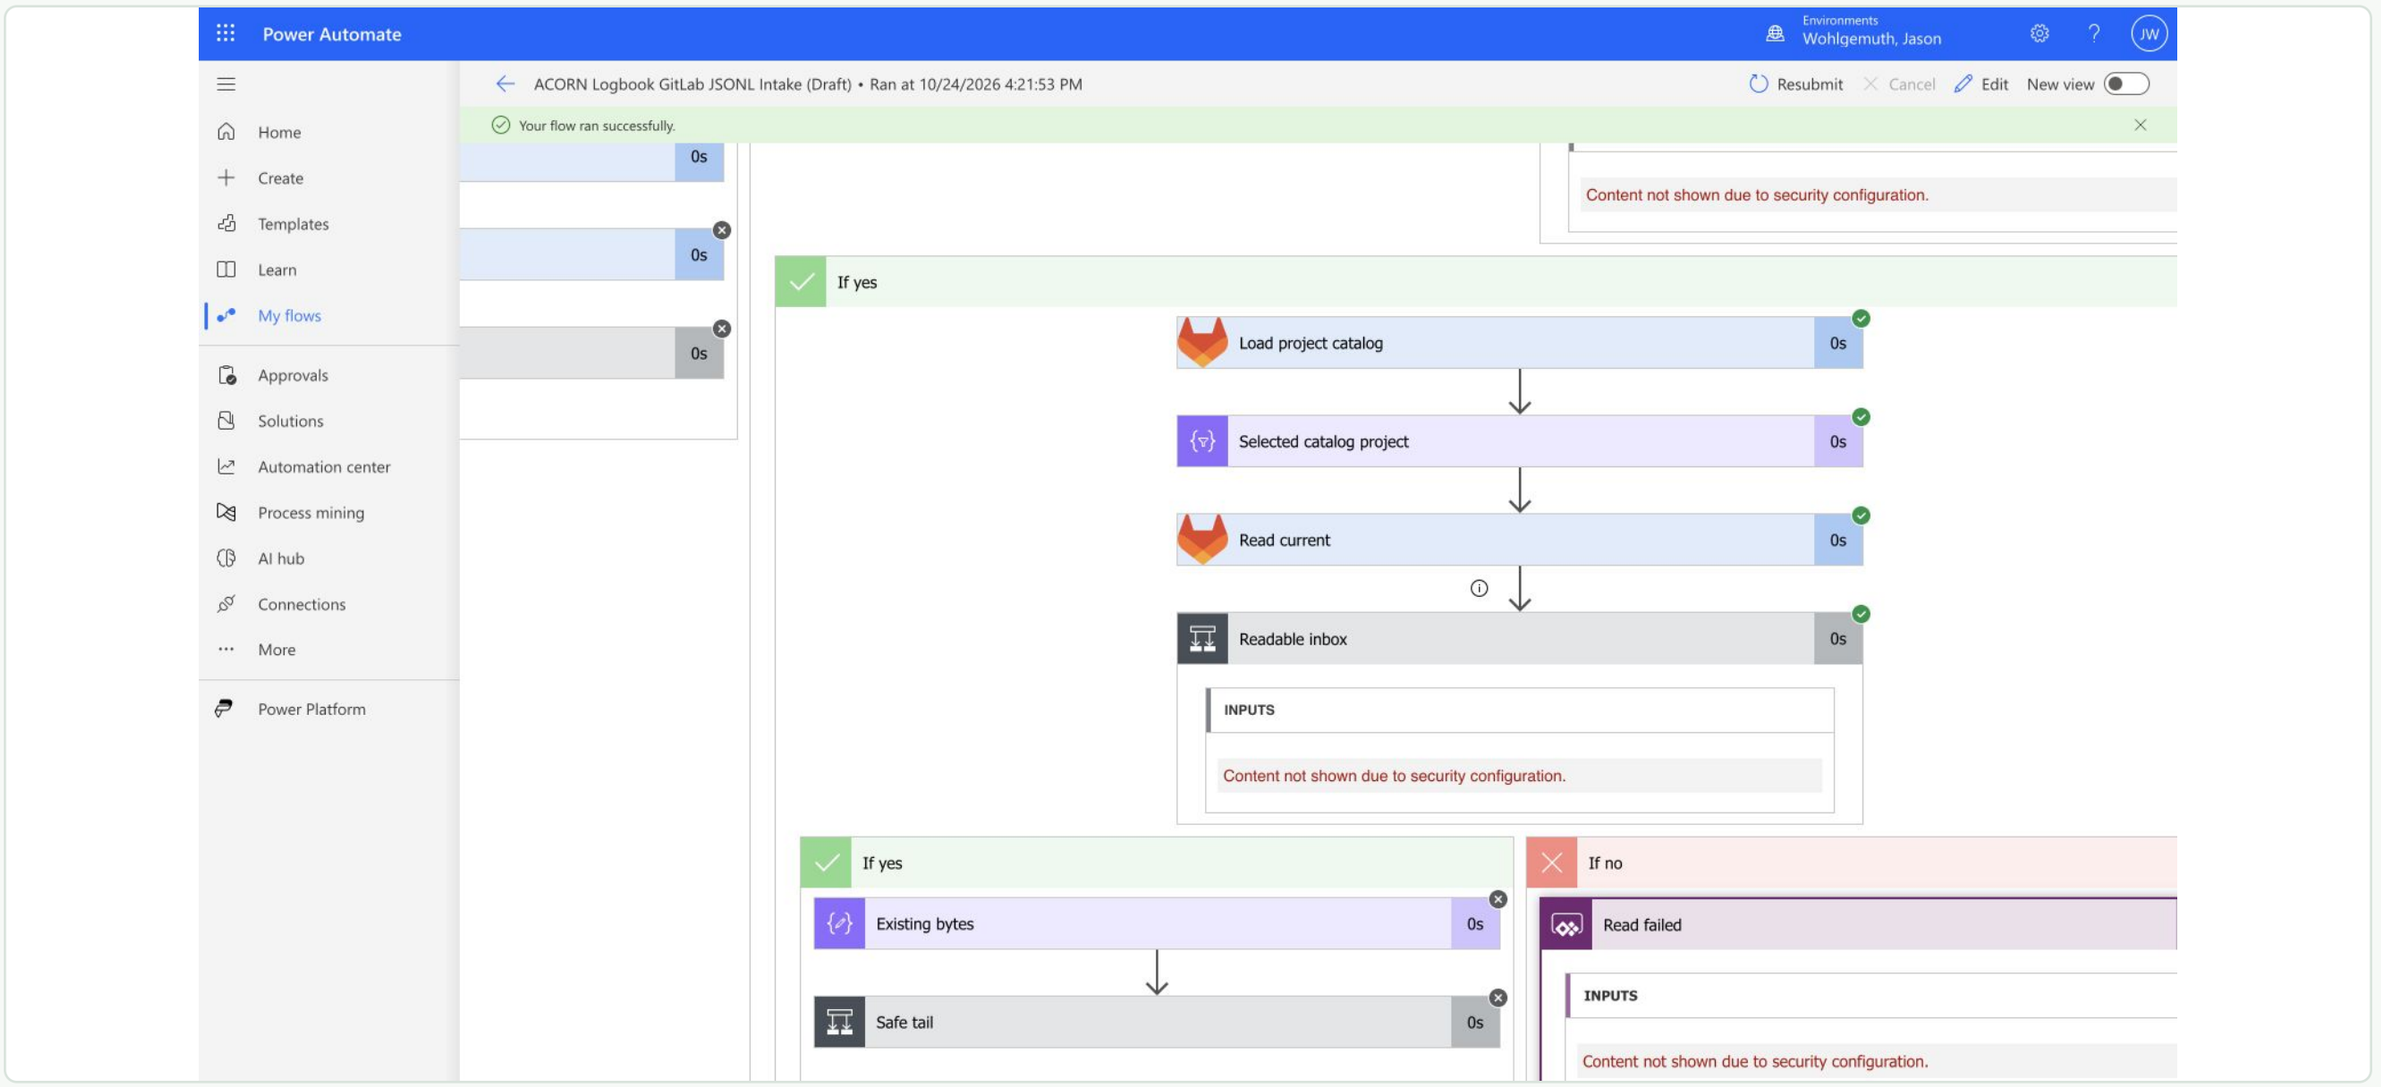

Handle corrections and unavailable projects

A rejected input is different from an unknown save outcome. Read the result panel before deciding what to do.

1. For Highlight needs a correction, choose Back to highlight, then Edit highlight when offered. Correct the indicated fields before submitting again.

2. For a project that is no longer available, ask the owner to inspect the catalog or use an appropriate available project only after the rejection allows editing.

3. An uncertain result should use Retry submission, not a fresh identity. The outcome reference on page 18 distinguishes these actions.

Verified flow-side unavailable-project rejection: write actions were skipped. This is operator evidence, not a screenshot of the current app correction panel.

Keep in mind: Current correction-panel wording is documented from the saved formulas. Live no-write rejection is verified; every published result-panel branch has not been visually accepted.

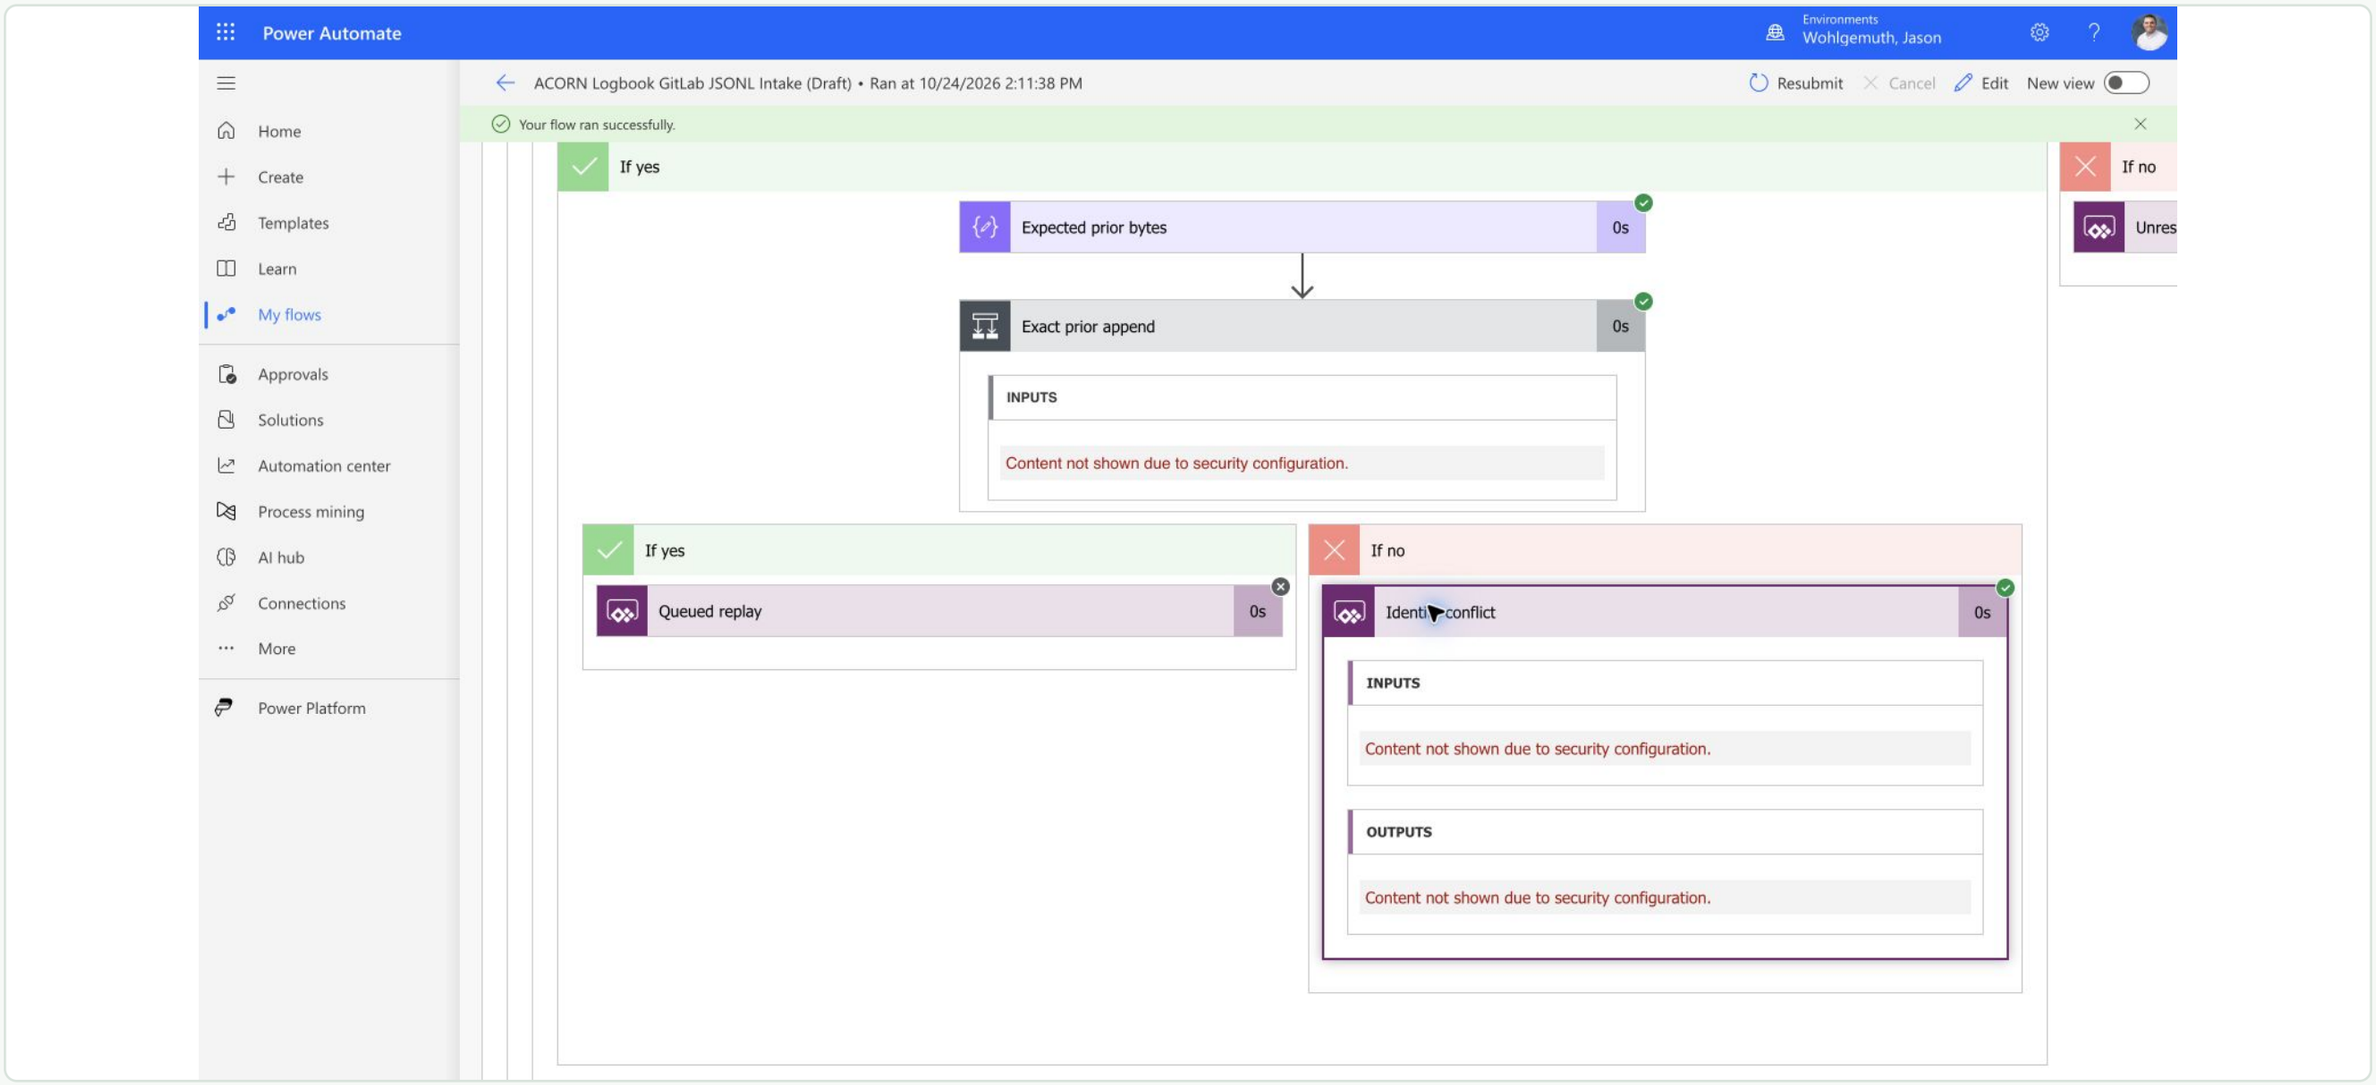

Keep conflicting receipts for review

Receipt needs review means the same submission ID is associated with different content. The app prevents normal resubmission of that conflict.

1. Keep the page, receipt ID, selected project, and approximate submission time.

2. Contact Jason Wohlgemuth. Do not modify an existing logbook line or invent a new ID to suppress the conflict.

3. The owner compares the frozen payload with the immutable GitLab evidence before choosing the next action.

Earlier verified flow acceptance: Identity conflict ran; append and replay branches were skipped.

Keep in mind: This screenshot proves server-side conflict handling. The app title Receipt needs review is the current formula-defined presentation.

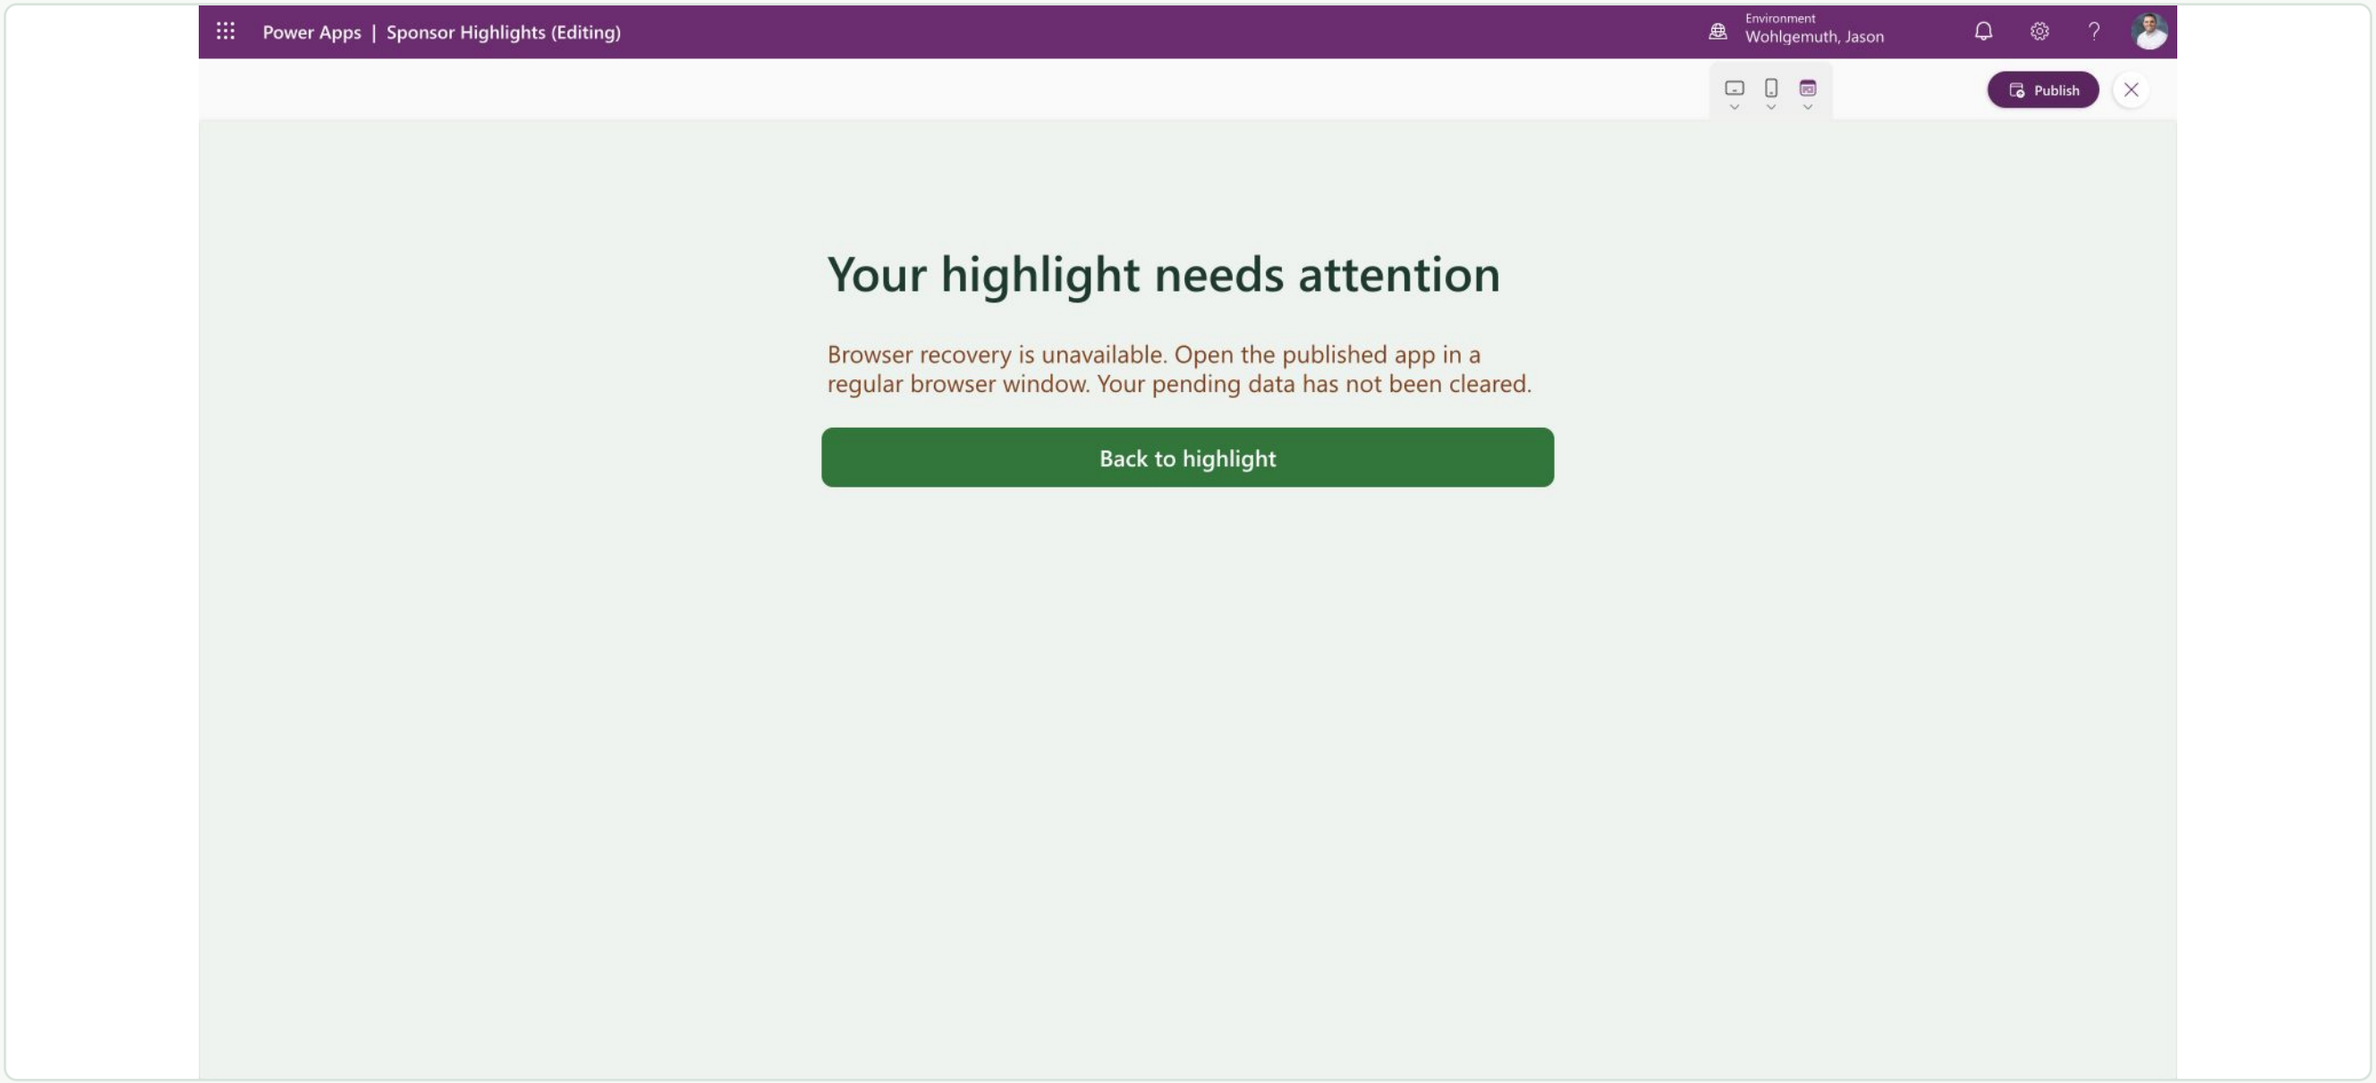

If browser recovery is unavailable

The app requires local pending storage before it sends a new highlight. If that storage fails, the submission is stopped.

1. Open the published app in a regular browser window. Studio preview is not the normal intake surface.

2. Read the status carefully: a preparation/storage failure before send is different from a send whose result cannot be confirmed.

3. Keep existing pending data. Do not clear browser data while trying to reconcile an uncertain submission.

Verified Studio preview: Your highlight needs attention with recovery guidance and Back to highlight.

Keep in mind: This failure panel was verified in Studio preview. Deliberate storage-denial acceptance in the published browser remains outstanding.

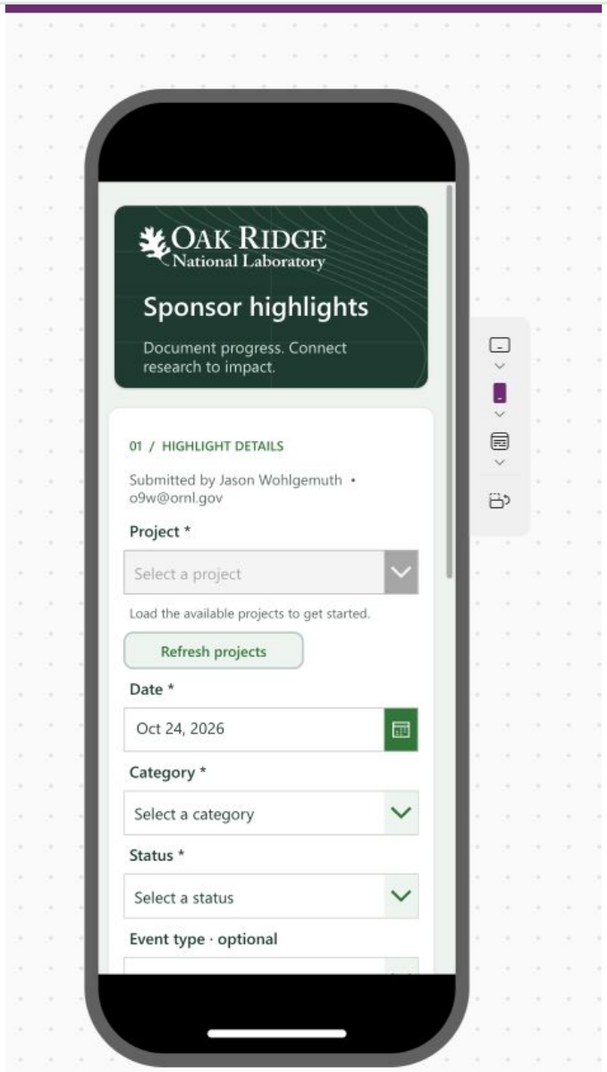

Use the form on a small screen

The layout stacks on a phone-sized viewport. Scroll through the same fields and result controls.

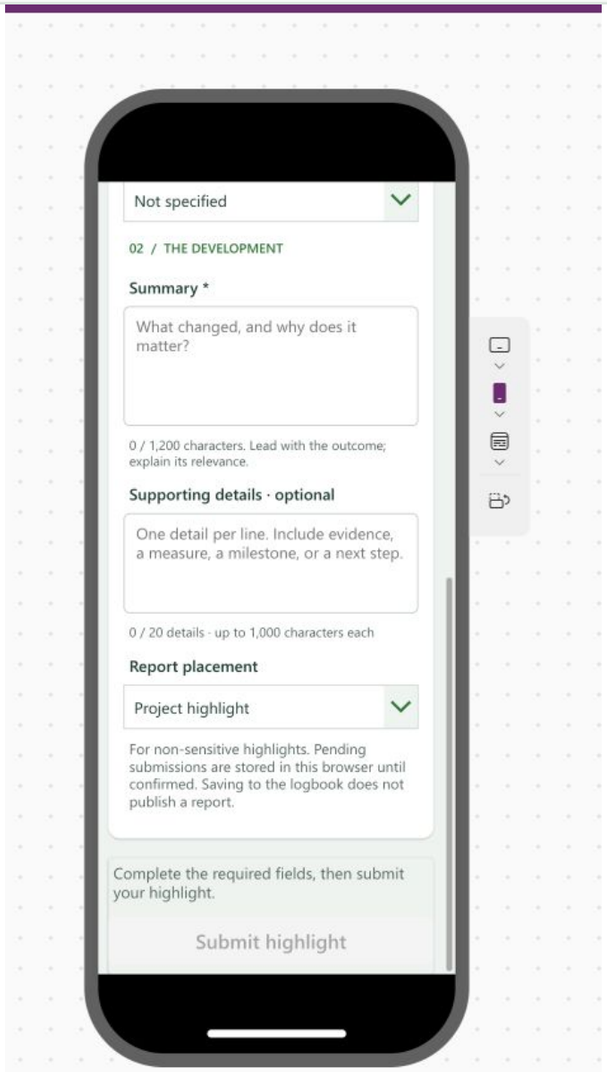

1. Check the selected project at the top, then continue to the summary, details, and submit action below.

2. Helper text and counters wrap. Keep the app in one tab while a submission is pending.

3. These are responsive Studio previews; they do not establish native mobile-app or mobile storage acceptance.

Earlier 360-pixel phone preview: upper fields; old project-button wording.

Earlier phone preview: summary, details, and submission area.

Review a submitted highlight

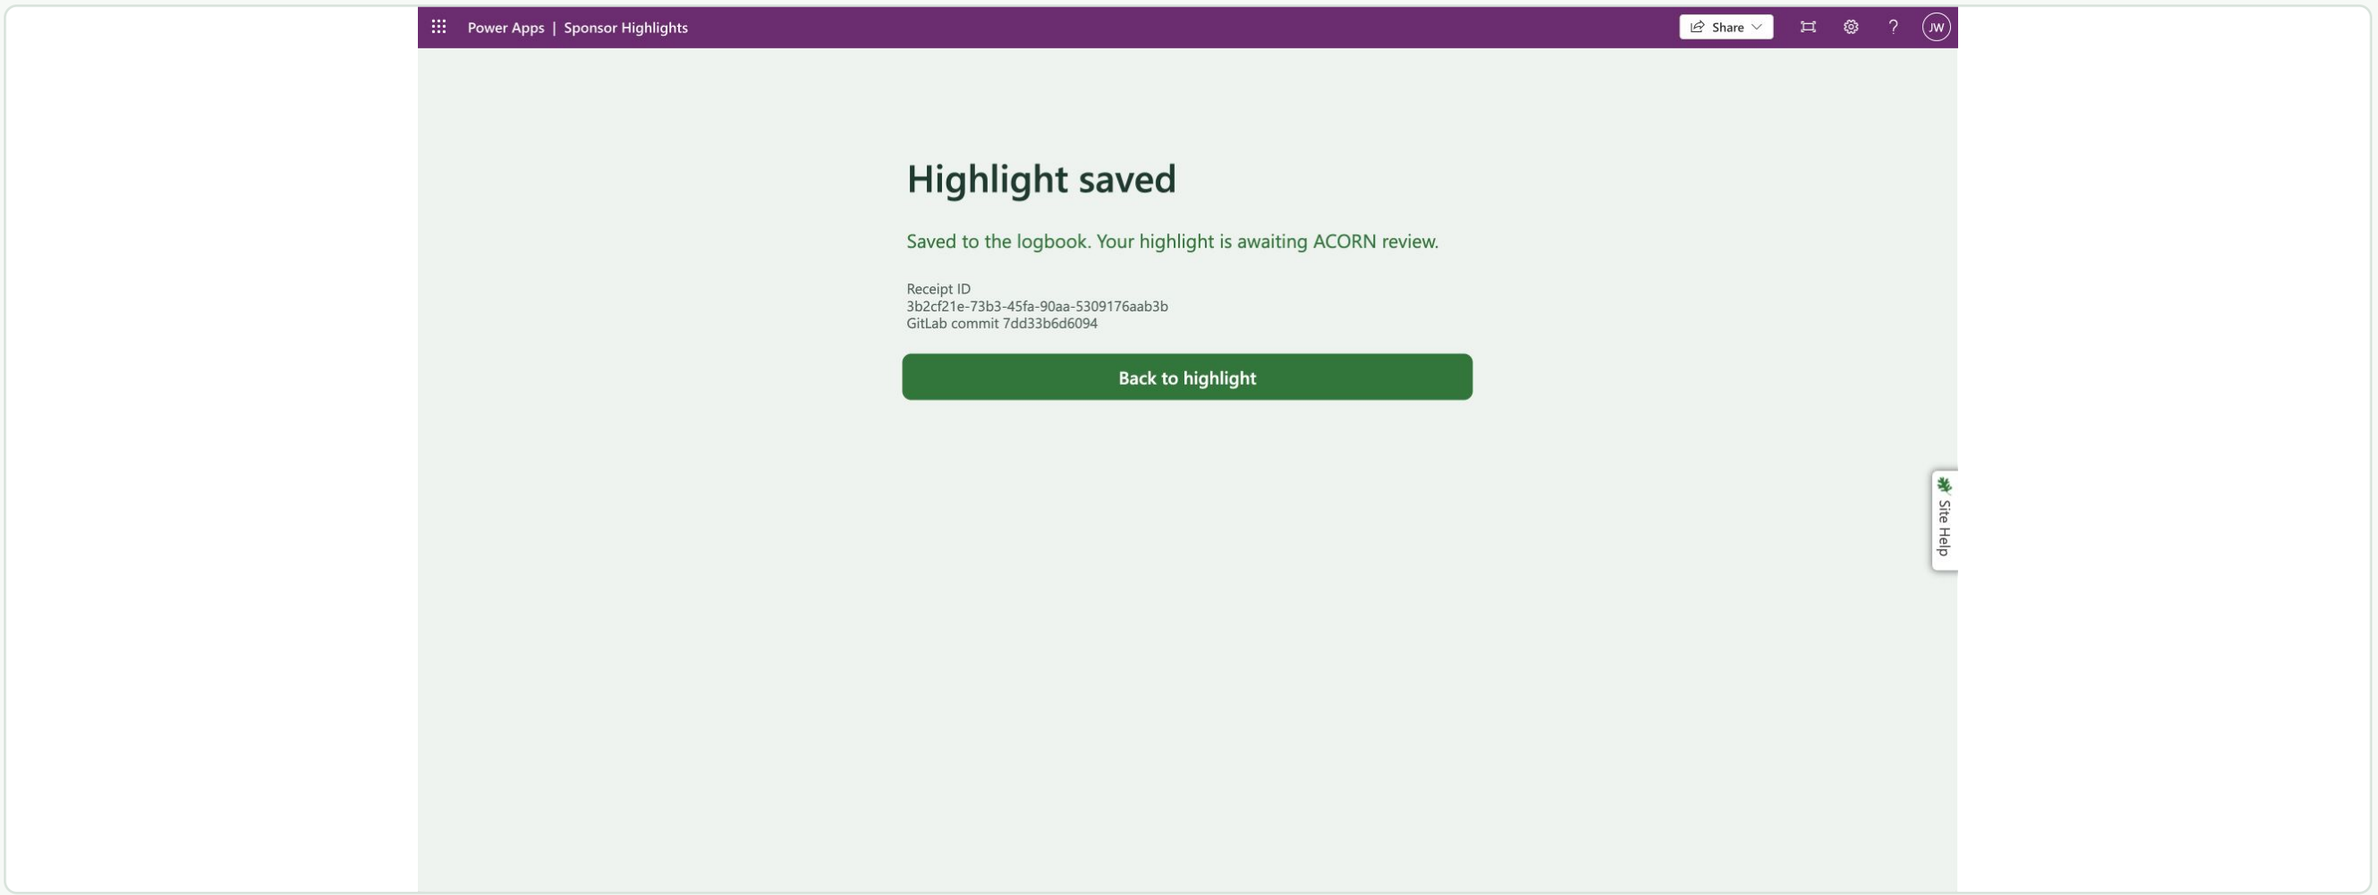

The PowerApp collects highlights; the current pilot does not provide a reviewer approval screen. The owner must provide the review material or link when available.

1. Confirm the project and receipt with the contributor or owner. Highlight saved confirms a logbook entry; it is not a review approval.

2. Check the date, category, progress status, report placement, summary, and supporting details against the underlying work. Look for a clear result, useful evidence, and appropriate non-sensitive content.

3. Record questions and requested changes in the review location supplied by the owner. For an already saved highlight, ask the owner to coordinate a correction; New highlight creates a separate entry.

4. When a GitLab review link is supplied, inspect its proposed changes and follow the project's established review and approval process. A notification alone does not establish approval.

Verified published acceptance: matching receipt for submission 3b2cf21e-73b3-45fa-90aa-5309176aab3b and commit 7dd33b6d6094.

Keep in mind: The screenshot is a verified intake receipt. No completed reviewer interface or end-to-end review cycle is evidenced. ACORN/Vergil admission and automated review handoff remain separate integration work.

Read review and report notifications

The pilot notification recipient is Jason Wohlgemuth. These event meanings describe how to respond when a valid notification or owner-provided handoff is available.

Event	What it signals	Reviewer action
review-needed	A review link is available.	Open the supplied review link, inspect the proposed content, and record feedback.
mr-created	A merge request was created.	Check its scope and review status; creation does not mean approval or merge.
artifact-ready	A report/package link is available.	Open the supplied package and check project, reporting period, and content before use.
report-no-changes	No changed report was produced for the stated period.	Confirm the period matches your expectation; ask the owner about missing expected work.
failed	Processing reported a failure.	Send the event reference and message to the owner; avoid resubmitting a confirmed highlight merely to retry reporting.

Keep in mind: The manual notification receiver has controlled test evidence. Automatic external callbacks and the complete review/report handoff are not yet integrated. No reviewer inbox or live review-screen screenshot is available; synthetic test links are not actual review work.

Result and action reference

Use the displayed outcome to choose the next step. A new submission and a retry are not interchangeable.

What you see	What it means	Next action
Submit highlight unavailable	Required fields or a safety check are not satisfied.	Complete required fields; read counters and status.
Loading projects...	Catalog request is running.	Wait; do not repeatedly click.
Highlight saved	Matching ID and commit receipt confirmed.	Back to highlight; then New highlight for distinct work.
Highlight needs a correction	Explicit rejection.	Back to highlight, then Edit highlight if offered.
Receipt needs review	Same ID has different stored content.	Keep the page and contact the owner.
Your highlight needs attention / Retry submission	Save could not be confirmed, or another safety check failed.	Read the message. Preserve pending content and retry the same ID when appropriate.
Browser recovery unavailable	Pending storage could not be prepared or restored.	Use the published regular-browser app; preserve existing pending data.

Keep in mind: The current app panel titles come from the saved formulas. Not every panel branch has a published visual acceptance screenshot; use the captioned server-side evidence for those branches.

Support and pilot limits

Use the pilot for non-sensitive highlights. Contact Jason Wohlgemuth (o9w@ornl.gov) if a submission or review handoff needs attention.

1. Include the receipt ID, selected project, approximate time and timezone, and the visible message. Include a screenshot when helpful; never include tokens or API keys.

2. Use the same browser profile and one app tab for a pending submission. Reload and app-tab recovery passed; full browser-process restart and published-browser storage-denial testing remain outstanding.

3. A confirmed save is distinct from review and report generation. Ask the owner for review material when no handoff has arrived.

4. The pilot remains in Wohlgemuth, Jason. Intermittent GitLab access failures and further acceptance work remain; shared deployment and a group notification destination are future phases.

Keep in mind: Prepared October 24, 2026, America/New_York. Screenshots are retained from the original walkthrough; this split did not submit a highlight, trigger a flow, or send a notification.

Open Sponsor Highlights

DEMO OVERVIEW

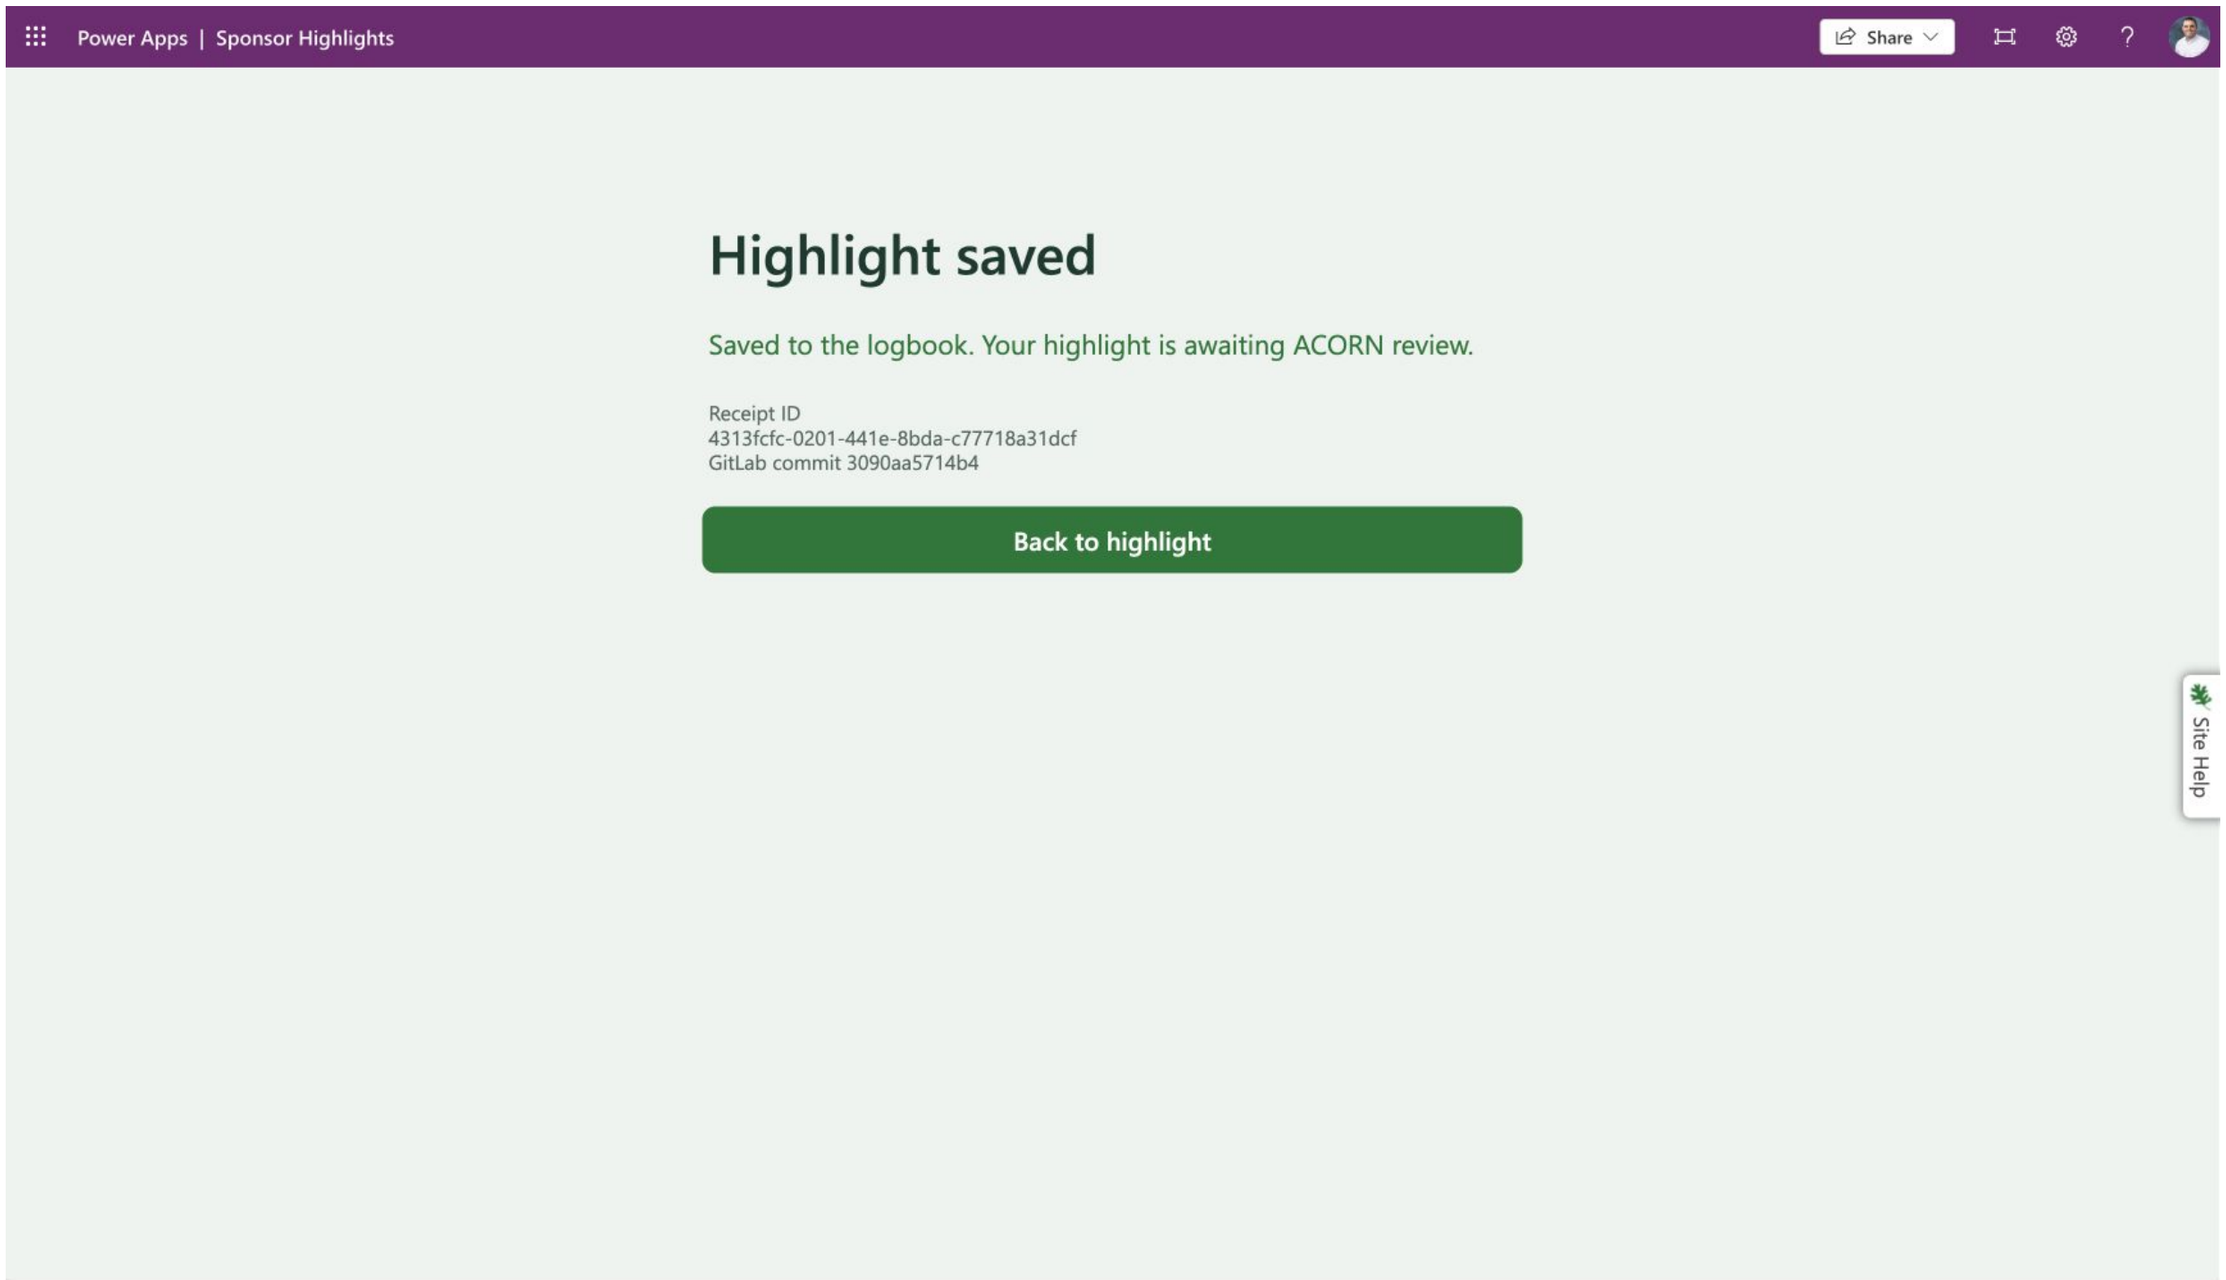

One highlight, from capture to report

The same captured personnel highlight travels through every step. Vergil is not required for this MVP.

1 Capture	PowerApp receipt + immutable GitLab JSONL commit
2 Review	Stage and inspect an explicit local destination
3 Ingest	Apply the approved entry; repeat adds nothing
4 Graduate	Preview and select one contributor candidate
5 Report	Retain the archived source in a local PDF

Presentation target: 8 minutes. Recorded cloud evidence is available if approved access is unavailable. Local output is not a published sponsor report.

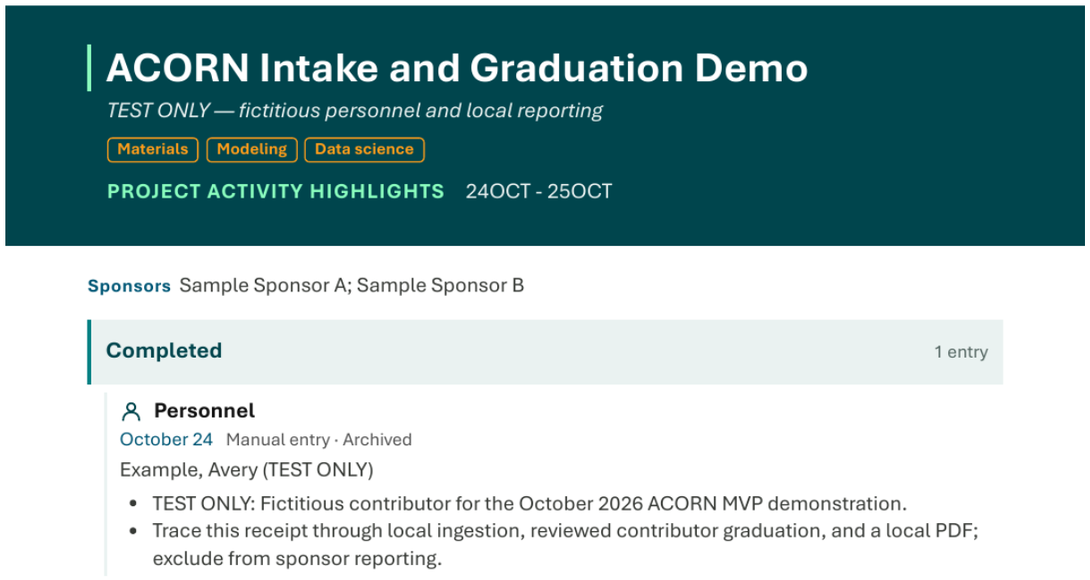

Capture confirmed; review still follows

Receipt UUID 4313fcfc-0201-441e-8bda-c77718a31dcf matches the immutable commit. A receipt confirms capture, not approval.

5:30-6:30 / LOCALLY RENDERED RESULT

The same entry is visible in the report
