START HERE

One workflow, two intake branches

Use the app link supplied by the owner. These are separate apps, not a branch selector within one form.

	SharePoint pilot	GitLab connector
Open	**Sponsor Highlights - SharePoint Pilot**	**Sponsor Highlights**
Storage	One shared list row per receipt. Combined logbook.jsonl refreshes every five minutes; individual receipt files remain available.	One appended line in the repository JSONL logbook; receipt identifies a commit.
Projects	13 seeded SharePoint catalog rows. Updates are maintained explicitly.	Repository configuration: .acorn.jsonc folders, or index.json / index.yaml discovery.
Current scope	Owner tests passed. Standard-license participant access is still awaiting validation.	Existing operational pilot. Custom connector requires appropriate premium use rights; intermittent GitLab denials remain.
After capture	Download combined logbook.jsonl for local ACORN review. Allow the next five-minute export run.	Stage the GitLab file URL or an exact local snapshot for ACORN review.

Do not send the same pending highlight through both apps. The original GitLab app remains enabled; the SharePoint app does not replace it yet.

WORKFLOW MAP

From highlight to reviewed report

Choose one intake route per highlight. Both preserve the original submission for later review.

Solid green: data handoff. Teams notices at save are automatic and best effort. Dashed: owner-triggered milestones; the local CLI sends no messages. A local PDF does not itself publish a report or send email.

Locate the deployed components

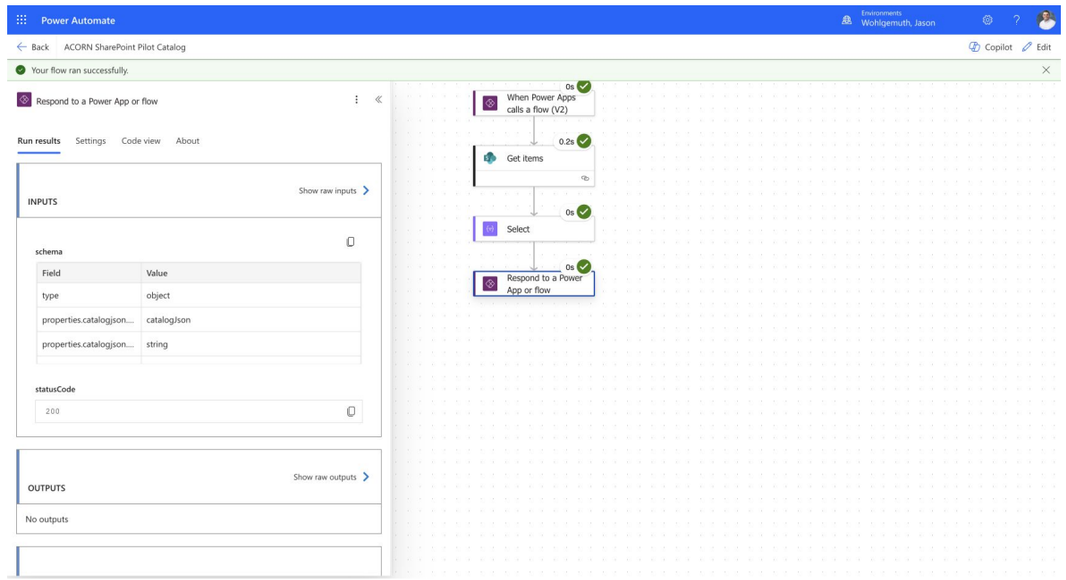

Component	SharePoint pilot	GitLab connector
Canvas app	163f110f-7f8a-401c-894e-0786b2c018a4	15ae605b-585b-49f5-a413-2b091f919a35

Browser slot	SponsorHighlightSharePointPending	SponsorHighlightPending
Destination	Research Enablement site: Intake Pilot list and JSONL Pilot library	Project 22464 / main / .acorn/intake/logbook.jsonl

Environment: **Wohlgemuth, Jason** (221f44a6-1468-ea4e-b93d-cd52f1723079). The SharePoint app binds only its two pilot flows. Both original GitLab flows remain enabled and unchanged.

Owner-only callback flow (separate from both app intake bindings): dd1d8f67-116c-f55d-7752-7c7d322691c5. It retains Dataverse receipt tracking and is not the standard-only contributor route.

Understand each project catalog

	SharePoint	GitLab
Source	13 rows seeded from retained revision 03ff5836289447034f40f2a4898c155441e6cb66. No automatic sync.	.acorn.jsonc folders is authoritative, including an empty list. Without it, find folders with index.json or index.yaml.
Response	catalogjson text: source=sharepoint, projects=[{id,label}]. More than 1,000 rows returns catalog_limit with an empty list.	Choices correspond to canonical folders at one repository revision; invalid config or denied access stops discovery.
Acceptance	Owner manual and app loads passed. Overflow is authored but not tested.	Successful reads do not prove later writes; network restrictions may be intermittent.

October 26 catalog flow capture. Catalog membership does not replace ACORN folder/member authorization during later admission.

Preserve the SharePoint storage contract

Field / behavior	Contract
SubmissionId	Required, unique 36-character UUID. Find/read the receipt before confirming; changed payload under the same UUID conflicts.
PayloadBase64A / B	Base64 of exact original UTF-8 JSON. A holds the first 45,000 encoded characters; B holds the remainder. Encoding is not encryption.
Display fields	ProjectId, Summary and SubmitterEmail are for viewing; do not reconstruct the export from them.
JSONL export	Receipt: decode A + B, add LF and verify UUID.jsonl. Combined: one serialized five-minute flow rebuilds logbook.jsonl from list rows, verifies exact bytes and skips unchanged writes.
ExportStatus / URL	Pending until exact readback succeeds; then Exported with the confirmed file location. A receipt alone is not a successful export.

Server checks include envelope shape, raw size/newlines, caller identity, timestamps and exact catalog membership. Combined export caps at 5,000 rows and 10 MiB, retaining the prior file on validation failure. Boundary and concurrent-arrival acceptance remains open. Standard SharePoint HttpRequest is used; no premium generic HTTP action is introduced.

Read SharePoint run evidence

Read action outcomes, not just the overall run color. A replay can fail non-overwrite file creation while successfully reading and confirming the existing exact file.

Case	Observed October 26	Run suffix
Fresh app + Teams	Receipt, export/readback, response and Teams action succeeded.	...9436911789262446685 1CU16
Exact replay after Teams	Receipt creation skipped; existing file matched; Teams skipped.	...9274096325003136304 6CU21
Changed payload	Conflict branch succeeded; receipt/file writes skipped.	...1198062104599069564 4CU06
Malformed envelope	Parse failed; persistence skipped; outer response succeeded.	...1118999575780268963 9CU25

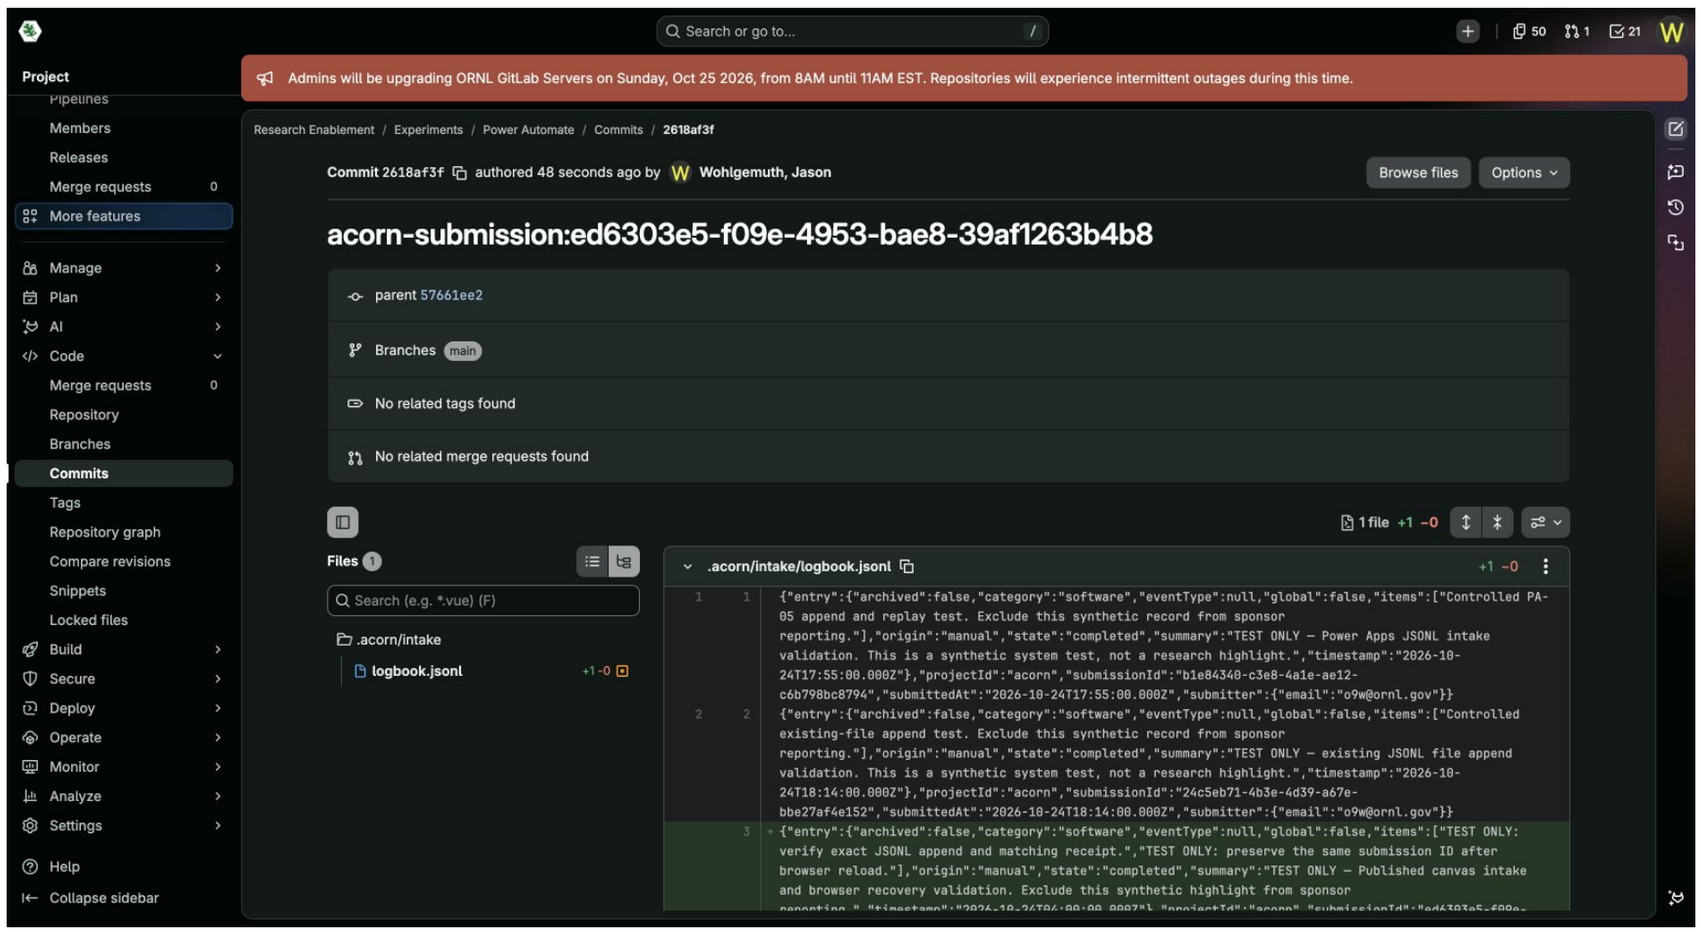

Response outputs: status, submissionid, exportstatus, exportfileurl and receipturl. The app accepts exported only with a matching UUID, received status, exported state and expected file URL. Uncertain export retains the frozen payload and offers Retry JSONL export.

Full run IDs and action evidence: sharepoint-pilot.md and _assets/sharepoint/. Secure history hides response values; the published app confirmed the successful response contract. Failure/retry panels still require app-driven acceptance.

GITLAB BRANCH

Verify the GitLab commit and replay

Validate the caller/envelope, resolve the project, check immutable history for an exact replay, then conditionally append one line. Preserve every previous byte and verify the committed snapshot before success.

Dated append evidence. Exact replays return the verified prior commit without another append or Teams notice. History lookup is bounded; missing proof remains unresolved. Preserve the ID and payload across timeouts or network denials.

PA-02 is closed under the owner-approved known-limitation decision. That decision does not establish reliable writes or close the remaining boundary, concurrency or restore tests.

SHARED LOCAL WORKFLOW

Bring either JSONL source into local review

SharePoint: download the combined logbook.jsonl after the next five-minute refresh. Preserve the selected original rows and UUIDs. The owner-context three-row local report passed October 26; intended-user and broader export acceptance remain open.

From the prepared demo directory, use acorn on PATH. intake.json and report.json point to the same separate demo index. Replace BATCH_ID below with the value printed by stage.

```
cd output/pdf/sharepoint-demo-20261026
# 1. Stage the three exact selected rows.
acorn --offline intake stage --batch --config intake.json \
  --source selected-demo.jsonl
# 2. Inspect; 3. apply with the normal Yes / No buttons.
acorn --offline intake inspect --config intake.json --batch-id BATCH_ID
acorn --offline intake apply --config intake.json --batch-id BATCH_ID
# 4. Generate the combined local PDF.
acorn --offline report --config report.json \
  --from 2026-10-26T00:00:00Z --through 2026-10-27T00:00:00Z \
  --dry-run --combine
```

Open .acorn/reports/report.pdf. Defaults use the current directory and all configured projects (only acorn here). Combined mode needs no commit. Keep the fixed date window; --through has no time default. Set CHROME_PATH only if browser discovery fails.

GitLab file URLs use online stage with CI_SERVER_HOST and the existing protected credential reference, then the same local inspect / apply / report steps. Direct SharePoint URLs remain planned. Local reporting sends no messages or callbacks; optional graduation is separate.

Use the current graduation commands

After ingestion, use the current local graduation API. Supported entries can propose contributor or other metadata changes; unsupported entries remain unchanged.

```
acorn intake run --index project/index.json --dry-run
acorn intake run --index project/index.json --interactive
acorn intake run --index project/index.json --force
```

Mode	Meaning
--dry-run	Validate and preview; write nothing.
--interactive	Per-candidate Yes / No selection, then separate final write confirmation. No is the default.
--force	Accept all eligible promotions without prompts; validation, digest checks and exact backup remain.
--accept ID --expected-digest DIGEST	Apply only an explicitly reviewed selection with the pinned digest.

Promotion retains and archives source entries and writes an adjacent exact-byte backup. A bare run --index with eligible entries requires an explicit approval mode. Local run --index is distinct from the GitLab worker run --config. Neither local ingestion nor graduation sends milestone messages.

Operate notifications independently of storage

Route	Automatic Teams gate	Recovery limit
SharePoint	Create_receipt_SP and Mark_exported_SP must both succeed in the same run. Runs after response handling.	Exact replay skips. Export first confirmed on a later retry also skips the initial notice; no durable notice outbox.
GitLab	Queued_new must succeed. Runs after response handling.	Replay, rejection and unresolved results skip. A later notice failure does not roll back the saved commit.

Both use the existing Teams self-notification connection, secure action inputs/outputs and no automatic send retries. Notices omit summary/details and link to the stored record. Do not resubmit confirmed intake merely to generate a message.

Callback event	Required additional fields	Channel
mr-created / review-needed	merge_request_url, project_id	Teams / email
report-no-changes	project_id, through	Teams
artifact-ready	checksum, package_url, project_id, through	Email
failed	message, project_id	Email

Manual callback: exact Webhook ID + Event JSON. Unique claim; frozen payload and destination; Pending > Sending > Sent; concurrency one. Sent replay skips. Uncertain Sending holds for reconciliation against the recorded attempt. Never reset solely because a send timed out.

Separate proven behavior from release gates

Area	Current acceptance and next action
SharePoint pilot	Owner app submit, catalog, exact export, reload and new Teams action passed. Manual replay/conflict/malformed handling passed.
Remaining SharePoint gates	PA-19 to PA-21: catalog overflow, max sizes, concurrency, export-failure recovery, app conflict/replay, full restart and denied storage. PA-22: intended-participant access/handoff; the owner three-row report passed. PA-24/25: backup/restore and optional cutover. PA-23: combined-export boundary and arrival tests.
GitLab gates	PA-15: remaining tail/size cases; PA-16: concurrent writes; PA-17: complete restore acceptance. PA-02 closure records intermittent connectivity as a known limitation.
Backup	Native GitLab packages exist; full restore acceptance remains open. SharePoint solution contains its flows/reference; app inclusion and complete native export/restore are pending. Clipboard JSON/YAML is not a native backup.
Release boundary	Pilot remains in Wohlgemuth, Jason. Site membership unchanged. Owner premium access does not prove standard-user access. PA-12 shared-environment/channel migration remains separate.

Keep original pending receipts in their original app. Do not disable the GitLab route or widen sharing as part of documentation work. Teams/email are notifications; stored receipt, exact source and reviewed index are the evidence.
