One highlight, from capture to report

Demo walkthrough without Vergil

Current commands and reviewer controls | October 25, 2026

An eight-minute presentation using one captured TEST ONLY submission, local review, explicit approval and a local PDF. The screenshot appendix preserves dated cloud evidence.

01 // Capture

PowerApp receipt and immutable GitLab JSONL commit

02 // Review and apply

Inspect one proposed entry, then confirm the local change

03 // Graduate

Select the contributor promotion and confirm it separately

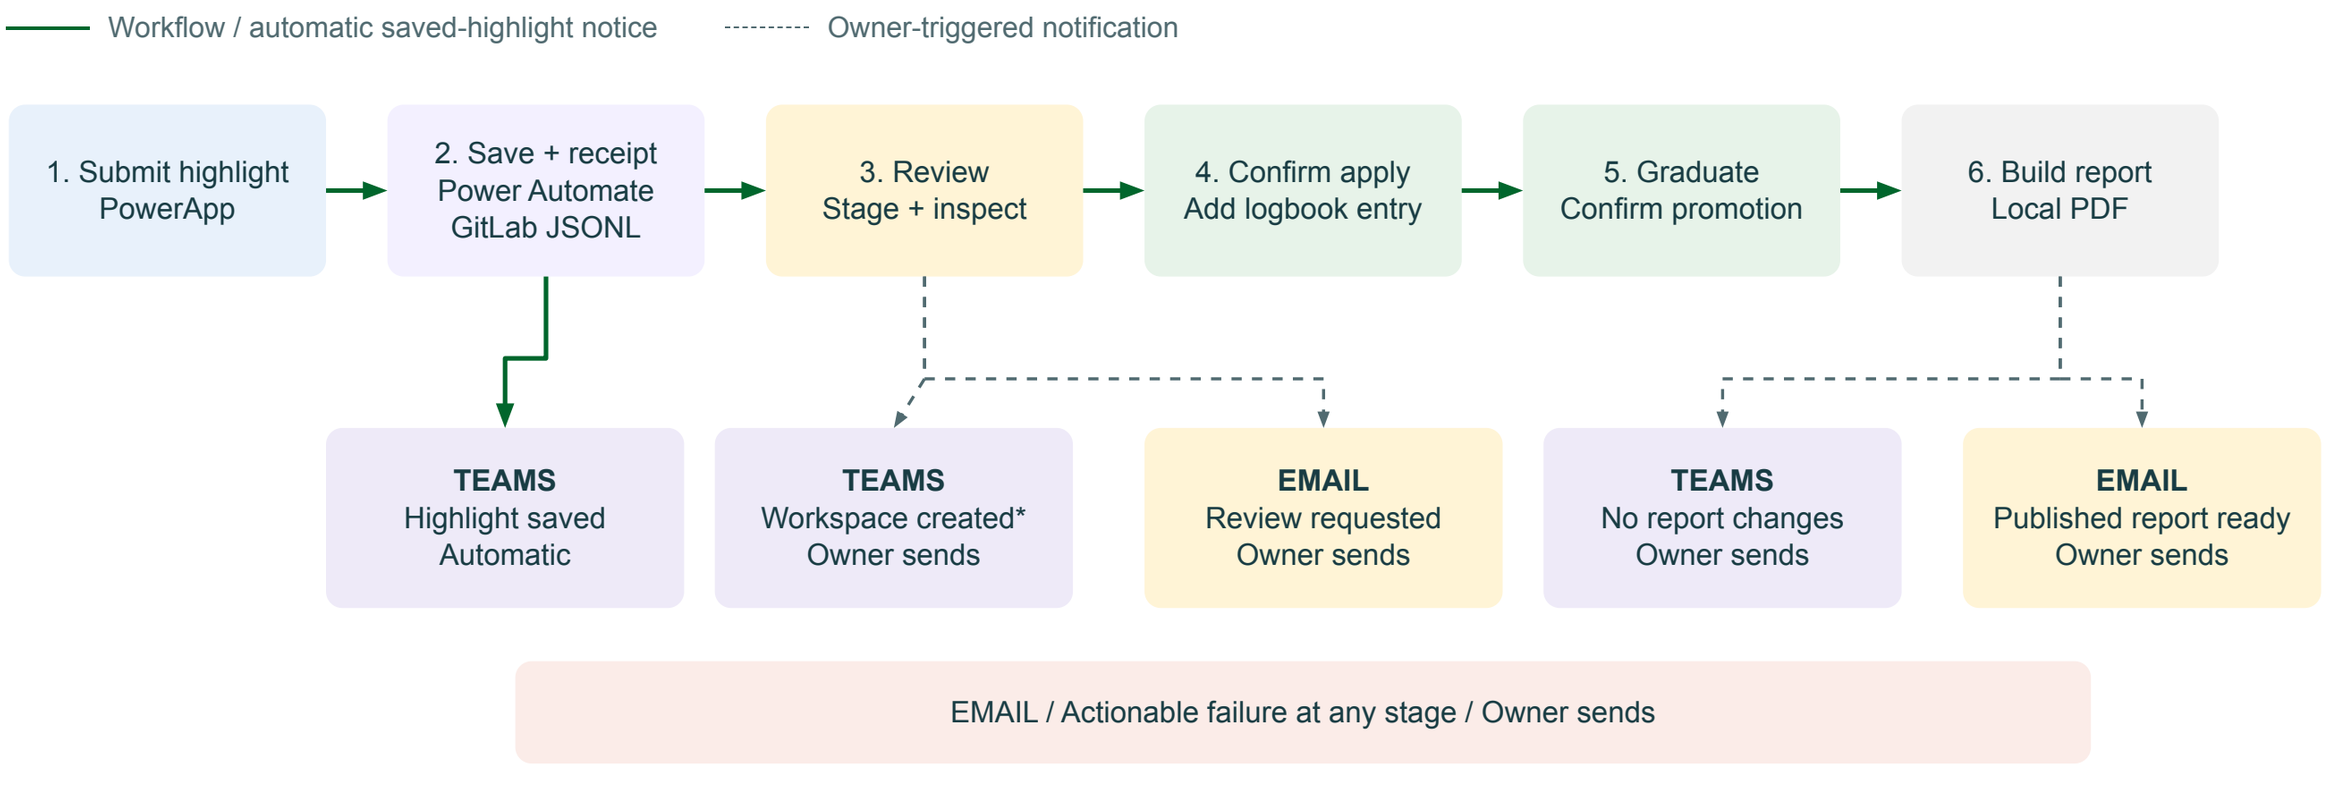

04 // Report

Open the local PDF and demonstrate safe replay

The following workflow map is retained from the user guide. The confirmed new-save Teams notice is automatic. Other review/report messages use the owner-triggered callback flow.

From Highlight to Report: Who Gets Notified

Follow one highlight through capture, human review and reporting. Notifications mark progress; the GitLab receipt and reviewed records remain the evidence.

Review stays human. Apply and graduation use separate Yes / No confirmations. Promotion is optional and depends on the entry. *Workspace created refers to an optional GitLab review workspace.

Messages after capture are manual today. The local CLI does not send them. The owner records the actual milestone in Power Automate. A local PDF alone does not trigger a published-report email.

Current recipient: Jason Wohlgemuth Teams self-chat for routine updates; email for review requests, published reports and actionable failures. Exact replays send no new notice.

Plan assets now live in local `_assets/` folders. The demo walkthrough PDF was refreshed October 25, 2026 with the current commands and confirmation controls. Historical screenshots and execution records retain their original paths; the links and commands in this walkthrough use the current layout.

This packet follows **one actual PowerApp submission** through GitLab JSONL, local review, ingestion, contributor graduation and a local PDF. The contributor, baseline project and report are **TEST ONLY**. Nothing in the local rehearsal publishes a report, sends a callback, drains the remote inbox or starts Vergil.

Start here

• Presentation walkthrough: the eight-minute story and captured screens.

• Resulting report: the archived personnel entry remains visible in the fixed October 24 reporting window.

• Rehearsal evidence: source and output hashes, local Git revision, exact commands, exit codes and elapsed time.

• Failure acceptance: isolated, non-writing test of the single unresolved response.

• CLI guide: supported command contract.

Eight-minute presentation

Time	Role and action	Point to show
0:00-1:30	Contributor opens Sponsor Highlights, loads the project list, selects `acorn`, and enters a non-sensitive highlight.	Use the recorded prepared form and saved receipt if cloud access fails. The saved example is category Personnel, status Completed, summary `Example, Avery (TEST ONLY)`.
1:30-2:15	Operator opens the GitLab commit.	Exactly one added line, no removed lines. A receipt confirms capture; it does not approve the content.
2:15-3:30	Reviewer runs stage and inspect.	Explicit project/member mapping, exact source bytes, one proposed entry and a readable diff. The index is unchanged before approval.
3:30-4:15	Reviewer approves the disposable local change and applies it.	One entry. Repeat apply produces no duplicate.
4:15-5:30	Reviewer previews graduation candidates, then selects the contributor entry with the reviewed digest.	Ingestion and graduation are separate approvals. Graduation adds one contributor and archives the retained source entry; unrelated metadata stays unchanged.
5:30-6:30	Operator opens the local PDF.	The same entry is visible with its Archived label. The output is local, not a published sponsor report.
6:30-7:30	Operator repeats graduation and tries an unknown project.	Stale graduation and rejected input fail without changing the index.
7:30-8:00	Presenter explains the next step.	Vergil will automate intake/review plumbing. Canonical review and promotion remain explicit. Shared deployment and production access approval are separate work.

The automated eleven-step rehearsal completed in 2.01 seconds on October 24, 2026, excluding human explanation and approval time. The eight minutes above is a presentation allocation, not a measured human rehearsal.

Repeat safely

Build the current CLI (`cargo build --bin acorn`, default PDF feature), then run from the repository root:

```
python3 .wiki/features/manual-jsonl-ingestion-graduation/_assets/rehearse.py \
  --workspace /tmp/acorn-demo-next-week-01 \
  --acorn target/debug/acorn \
  --chrome '/Applications/Google Chrome.app/Contents/MacOS/Google Chrome'
```

The workspace must not exist. The script refuses to reset an existing directory. Use a new name for each rehearsal; retain earlier evidence. It uses ACORN's **Yes / No** buttons for intake approval, selection of the contributor promotion, and final graduation approval. No is selected by default; Tab or the arrow keys switches selection and Enter confirms it. `y` and `n` also work; Escape or Ctrl+C cancels. No skips a graduation candidate; in this one-candidate rehearsal, skipping it stops the expected graduation checks. Declining the intake or final graduation approval stops the rehearsal without applying that change. Run in a terminal with both input and output attached. Interactive receipts appear in the terminal; the evidence records each command, confirmation mode and exit status.

`--approve-synthetic` permits an unattended check of **only the frozen TEST ONLY fixture**. It supplies `--yes` for intake apply and explicit `--accept` plus the preview digest for graduation. This is not Jason's personal review of production data. Apply replay and rejection checks also pass `--yes` to test validation without additional prompts. `--git /absolute/path/to/git` can select a Git executable if the system toolchain is unavailable.

The current graduation API is:

```
acorn intake run --index project/index.json --dry-run
acorn intake run --index project/index.json --interactive
# Accept all eligible promotions without prompting:
acorn intake run --index project/index.json --force
```

`--force` preserves validation, stale-digest checks and exact backups. Combining it with `--dry-run` writes nothing. The older `candidates` and `graduate` commands visible in historical manuals and transcripts still work as hidden compatibility commands; the refreshed demo PDF uses `run`. See the current command reference for reviewed-ID selection and all mode combinations.

The script verifies the immutable source hashes and exact line selection before writing, creates a disposable index, records all command results, creates a local Git commit using the explicitly synthetic `ACORN Synthetic Demo` identity, and renders the PDF twice. It asserts that retries, rejected apply and both report runs preserve the correct index. `evidence.json` is the local report manifest; `remotePublication` is false.

Confirmation acceptance

The earlier October 24 confirmation update passed 20 terminal checks and three interactive rehearsal paths: No, default Enter, Escape and Ctrl+C preserved the local index; Yes applied the reviewed change. Declining graduation also left no backup file. Revoking folder membership while either Apply prompt was open prevented the write after Yes, confirming that permissions are reloaded after approval. The complete interactive rehearsal passed all eleven steps with two native confirmation prompts; its recorded evidence records the confirmation mode for each command. The unattended synthetic rehearsal also passed using `--yes`. CLI integration tests verify redirected input/output cannot approve implicitly, and `--yes` retains stale-index, digest and replay protections. Final validation passed: `make lint`, `make test` (2,672 passed; 17 skipped), and the planning wiki validator.

The consolidated `run` API passed ten native terminal checks: per-entry selection, default No, final rejection, Escape/Ctrl+C, interactive dry-run, exact backups, and rejection of concurrent index changes. Both the unattended rehearsal and interactive rehearsal passed all eleven steps with the current commands. The interactive rehearsal used three native prompts. These checks used synthetic local data and sent no messages or repository updates. Final validation for the consolidated API passed: warning-free `make lint`, `make test` (2,694 passed; 17 skipped), the documentation book build, and the planning wiki validator.

The original rehearsal manifest and screenshots remain the captured demonstration record. This walkthrough and its refreshed PDF describe the current button controls and unattended invocation contract. The PDF adds captured screens and the workflow notification map.

Exact trace

Evidence	Value

The replay run reached **Queued replay** after reading the prior immutable commit and its parent; the new-write branch was skipped. Response values remain protected in run history. The saved flow's replay response

references that verified prior commit. The original app receipt and the downloaded snapshot establish the UUID/commit mapping.

`_assets/baseline.json` is a separate synthetic local project, not a downloaded canonical project index. `_assets/selected.jsonl` is unchanged capture data. `_assets/rejected.jsonl` intentionally changes the project selector and is a separate negative fixture, never submitted to the live flow. The index's contributor and selected archive flag are the only semantic changes between `_assets/ingested.json` and `_assets/graduated.json`.

Day-of fallback and boundaries

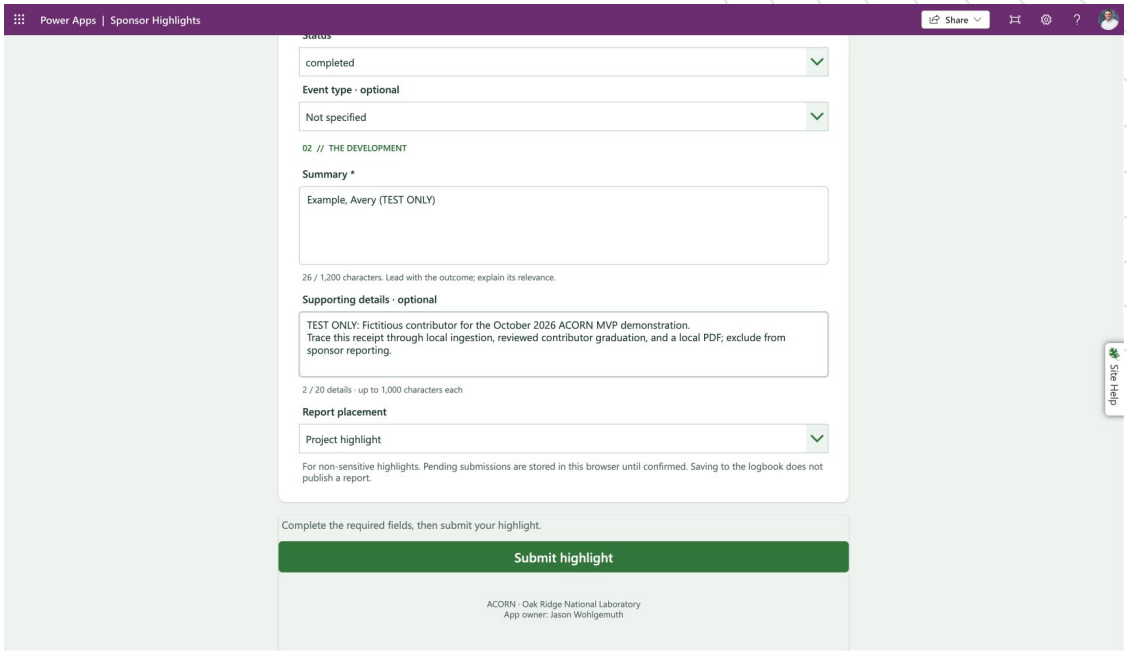

Try the approved cloud route once. If access is denied, stop that segment and show the captured form receipt, commit and replay screenshots; continue the local script with the exact frozen source. Say **“recorded cloud capture, live local review and reporting.”** Do not claim that a new cloud submission succeeded.

Use one browser tab and non-sensitive examples. A network denial is not a reason to rotate credentials or weaken access controls. Reliable egress/licensing approval and wider browser/concurrency acceptance remain in the intake plan. The remote TEST ONLY records remain in place. Before enabling a bot against any manually processed production data, approve the actual baseline using the verified handback procedure; local receipts alone do not prevent a fresh bot database from admitting those lines again.

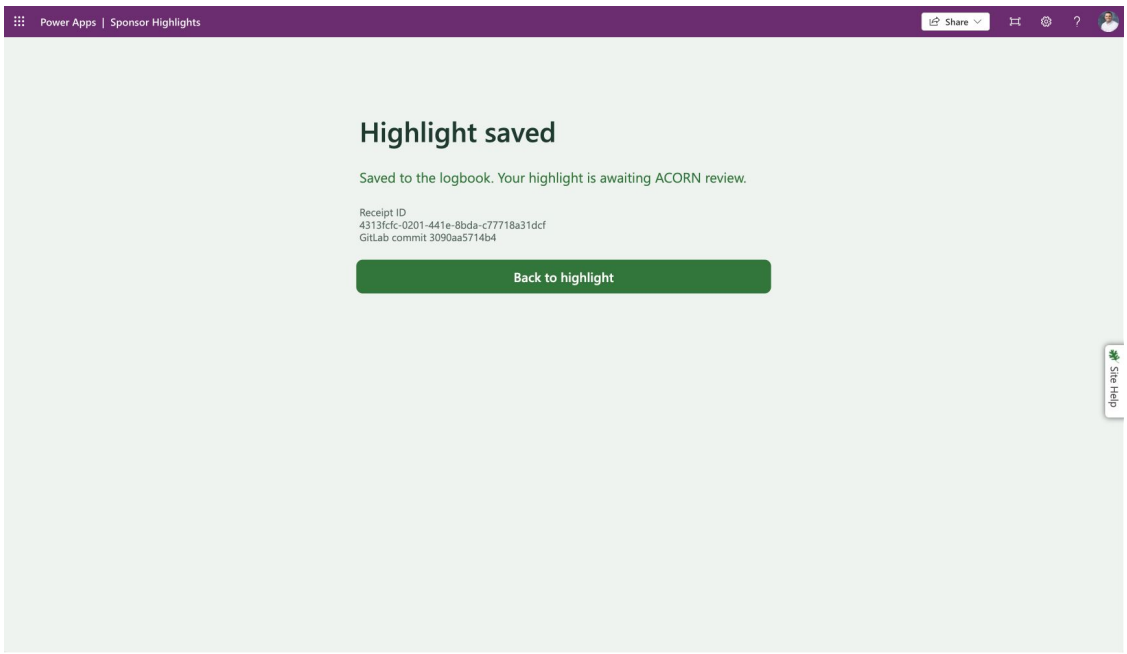

The demonstration uses `report --dry-run --combine` and an explicit local-only evidence manifest. This avoids presenting publication-shaped previews as evidence of remote publication.

Captured form and receipt

Historical evidence captured October 24, 2026. UI labels or paths in these screens may differ from current commands.

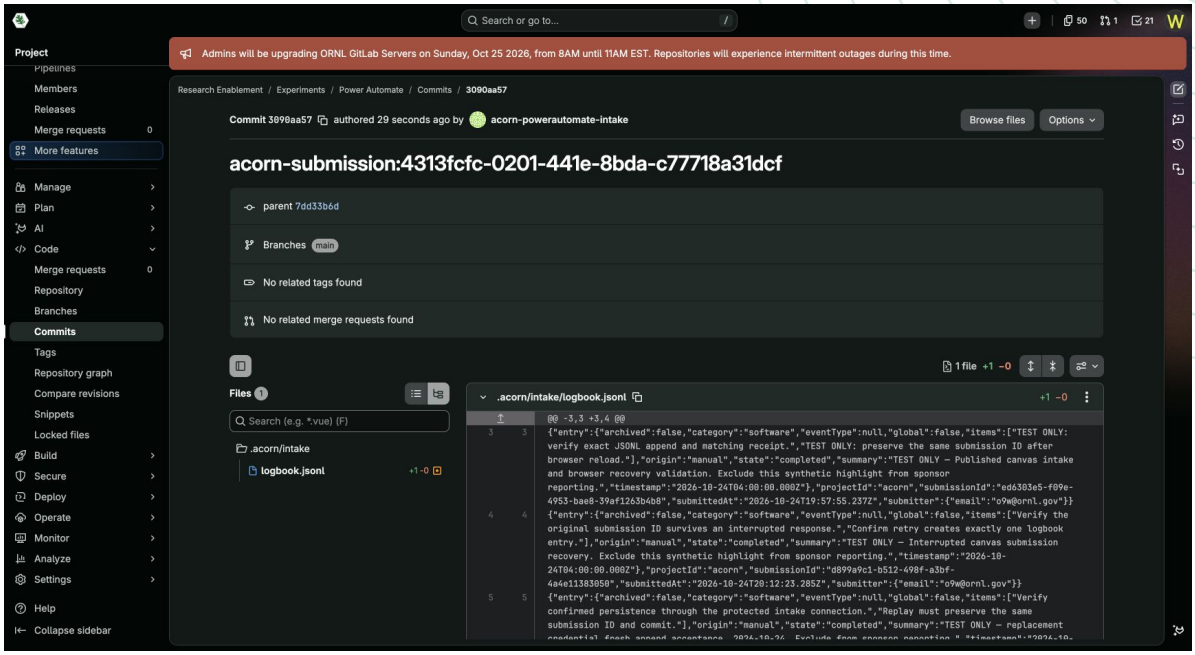

Prepared TEST ONLY personnel highlight.

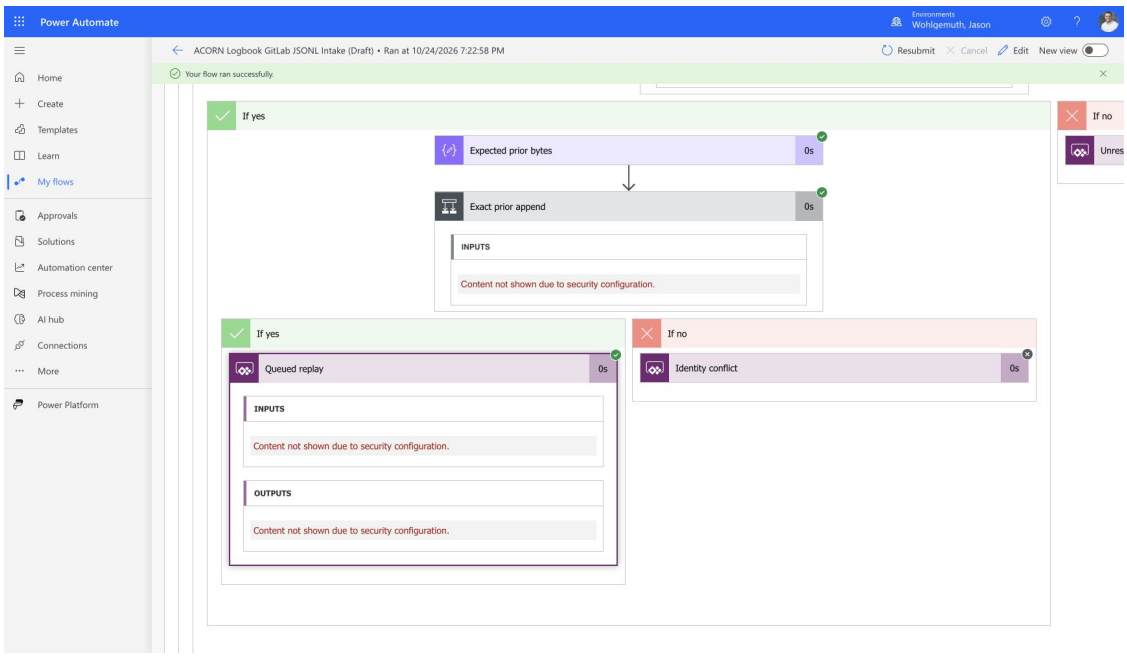

Saved receipt: capture is confirmed; content review follows.

Captured append and replay

Historical evidence captured October 24, 2026. UI labels or paths in these screens may differ from current commands.

GitLab commit: exactly one added JSONL line.

Exact replay: the prior immutable commit is reused.

Local report result

Historical evidence captured October 24, 2026. UI labels or paths in these screens may differ from current commands.

Local TEST ONLY report. The retained entry is archived; this is not remote publication.
